<i>Preface</i>	ix
<b>1 Metric Diophantine Approximation: Aspects of Recent Work</b>	<b>1</b>
<i>Victor Beresnevich, Felipe Ramírez and Sanju Velani</i>	
1.1 Background: Dirichlet and <b>Bad</b>	1
1.2 Metric Diophantine Approximation: The Classical Lebesgue Theory	9
1.3 Metric Diophantine Approximation: The Classical Hausdorff Theory	18
1.4 The Higher-Dimensional Theory	27
1.5 Ubiquitous Systems of Points	46
1.6 Diophantine Approximation on Manifolds	53
1.7 The Badly Approximable Theory	74
<b>2 Exponents of Diophantine Approximation</b>	<b>96</b>
<i>Yann Bugeaud</i>	
2.1 Introduction and Generalities	96
2.2 Further Definitions and First Results	99
2.3 Overview of Known Relations Between Exponents	106
2.4 Bounds for the Exponents of Approximation	109
2.5 Spectra	114
2.6 Intermediate Exponents	121
2.7 Parametric Geometry of Numbers	124
2.8 Real Numbers Which Are Badly Approximable by Algebraic Numbers	126
2.9 Open Problems	127

<b>3</b>	<b>Effective Equidistribution of Nilflows and Bounds on Weyl Sums</b>	136
	<i>Giovanni Forni</i>	
3.1	Introduction	137
3.2	Nilflows and Weyl Sums	142
3.3	The Cohomological Equation	152
3.4	The Heisenberg Case	159
3.5	Higher-Step Filiform Nilflows	174
<b>4</b>	<b>Multiple Recurrence and Finding Patterns in Dense Sets</b>	189
	<i>Tim Austin</i>	
4.1	Szemerédi's Theorem and Its Relatives	189
4.2	Multiple Recurrence	192
4.3	Background from Ergodic Theory	197
4.4	Multiple Recurrence in Terms of Self-Joinings	212
4.5	Weak Mixing	222
4.6	Roth's Theorem	230
4.7	Towards Convergence in General	238
4.8	Sated Systems and Pleasant Extensions	242
4.9	Further Reading	248
<b>5</b>	<b>Diophantine Problems and Homogeneous Dynamics</b>	258
	<i>Manfred Einsiedler and Tom Ward</i>	
5.1	Equidistribution and the Gauss Circle Problem	258
5.2	Counting Points in $SL_2(\mathbb{Z}) \cdot i \subseteq \mathbb{H}$	267
5.3	Dirichlet's Theorem and Dani's Correspondence	278
<b>6</b>	<b>Applications of Thin Orbits</b>	289
	<i>Alex Kontorovich</i>	
6.1	Lecture 1: Closed Geodesics, Binary Quadratic Forms, and Duke's Theorem	289
6.2	Lecture 2: Three Problems in Continued Fractions: ELMV, McMullen, and Zaremba	306
6.3	Lecture 3: The Thin Orbits Perspective	310
	<i>Index</i>	318
