

The Grammar Network

Cognitive linguists and psychologists have often argued that language is best understood as an association network; however, while the network view of language has had a significant impact on the study of morphology and lexical semantics, it is only recently that researchers have taken an explicit network approach to the study of syntax. This innovative study presents a dynamic network model of grammar in which all aspects of linguistic structure, including core concepts of syntax (e.g., phrase structure, word classes, grammatical relations), are analyzed in terms of associative connections between different types of linguistic elements. These associations are shaped by domain-general learning processes that are operative in language use and sensitive to frequency of occurrence. Drawing on research from usage-based linguistics and cognitive psychology, the book provides an overview of frequency effects in grammar and analyzes these effects within the framework of a dynamic network model.

HOLGER DIESEL is Professor of English Linguistics at the Friedrich-Schiller-Universität Jena. His publications include two monographs, *Demonstratives: Form, Function and Grammaticalization* (1999) and *The Acquisition of Complex Sentences* (Cambridge, 2004), and more than 50 articles in journals and edited volumes.

Preface

Cognitive linguists have often argued that language is best understood as an associative network, but while the network view of language has had a significant impact on the study of morphology and lexical semantics, few studies have taken an explicit network approach to the analysis of syntax. This book presents a dynamic network model of grammar in which all aspects of linguistic structure, including core concepts of syntax (e.g., word classes, grammatical relations, constituent structure), are analyzed in terms of associative connections between different aspects of linguistic knowledge. These associations are shaped by domain-general learning processes that are operative in language use and sensitive to frequency of occurrence. A wealth of recent results indicate that frequency affects the activation and processing of lexemes, categories and constructions, which can have long-lasting effects on the development of linguistic structure.

Drawing on research from various subfields of linguistics (e.g., construction grammar, cognitive semantics, historical linguistics, linguistic typology) and cognitive psychology (e.g., language acquisition, sentence processing, structural priming), the book provides an overview of frequency effects in grammar and analyzes these effects in the framework of a dynamic network model.

The book is written for a broad readership, including researchers and graduate students of linguistics, psycholinguistics and cognitive science. It does not presuppose expert knowledge in any research area and approaches the study of grammar from an interdisciplinary perspective. While written as a monograph, the book can also be used as an advanced textbook for a seminar on usage-based linguistics or functional-cognitive grammar.

The idea of writing this book was born during my senior fellowship at the Freiburg Institute for Advanced Studies in 2011, when I also taught a seminar on usage-based grammar at the Graduiertenkolleg (Frequency Effects in Language) of the University of Freiburg. I would like to express my gratitude to the Freiburg linguists for providing me with a very stimulating environment and for many fruitful discussions.

After my visit to the University of Freiburg, it took another four years of reading and preparation before I eventually began to write the first chapters of

the manuscript during my fellowship at the Wissenschaftskolleg in Berlin (WIKO), where I joined an interdisciplinary research group on language evolution. During my stay at the WIKO (2015–2016), I had numerous discussions with language scientists from other disciplines who convinced me that my project would be of interest not only to linguists but also to researchers and students of psychology and cognitive science. As a consequence, I have written this book from an interdisciplinary perspective so that it is accessible to readers from different backgrounds. I am very grateful for the support I received from the Wissenschaftskolleg in Berlin and would like to thank the members of our research group, in particular, Luc Steels and Peter Gärdenfors.

A special word of thanks is due to Martin Haspelmath, who read drafts of several chapters of the manuscript and provided many valuable and insightful comments. I am also grateful to Michael Arbib, Heike Behrens, Barthe Bloom, Merlijn Breunese, Daniel Jach and Eva-Maria Orth for stimulating discussions and to my colleagues from the University of Jena for providing feedback on several colloquium presentations on topics related to this book. Finally, I would like to thank the editor of Cambridge University Press, Helen Barton, for her support and encouragement.

Abbreviations

1	first person
2	second person
3	third person
A	transitive agent
ACC	accusative
ADJ	adjective
ADV	adverb
AdvP	adverb phrase
A(G)	agent
AGR	agreement
AP	adjective phrase
ART	article
ASP	aspect
ASSOC	associative
ATTR	attribute
AUX	auxiliary verb
CAUS	causative
CC	complement clause
CL	classifier
CLIT	clitic
COMPL	complement
CONJ	conjunction
COP	copular verb
CV	consonant-vowel
DAT	dative
DEM	demonstrative
DET	determiner
DITRANS	ditransitive
DEC	declarative
DOM	differential object marking
DU	dual
DUR	durative

xvi	List of Abbreviations
EMPH	emphasis
ERG	ergative
F	feminine
FUT	future
G/GEN	genitive
GER	gerund
IC	immediate constituent
IMPF	imperfective
INCEP	inceptive
IND	indicative
INF	infinitive
INST	instrument
INTER	interjection
