Behavioral and Brain Sciences (BBS) is a unique scientific communication medium, providing the service of Open Peer Commentary for reports of significant current work in psychology, neuroscience, behavioral biology and cognitive science. Each manuscript is judged by BBS referees and editors to be appropriate for Commentary (see Criteria below), it is circulated electronically to a large number of commentators selected (with the aid of systematic bibliographic searches and e-mail Calls for Commentaries) from the BBS membership and the world professional readership of BBS, in order to assure the archival validity of BBS as well as any pertinent complementary or supplementary material, such as illustrations, or principles of an accepted or influential line of work; (4) it unifies a substantial established aspects of current research and theory; (3) it criticizes the findings, practice, or principles of an accepted or influential line of work; (4) it unifies a substantial established aspects of current research and theory; (3) it criticizes the findings, practice, or principles of an accepted or influential line of work; (4) it unifies a substantial established aspects of current research and theory; (3) it criticizes the findings, practice, or principles of an accepted or influential line of work; (4) it unifies a substantial established aspects of current research and theory; (3) it criticizes the findings, practice, or principles of an accepted or influential line of work; (4) it unifies a substantial. Some appropriate rationales for seeking Open Peer Commentary would be that: (1) the material bears in a significant way on some current controversial issues in behavioral and brain sciences; (2) its findings substantively contradict some well-accepted research; (3) it demonstrates a serious gap in current research; (4) it is relevant to dissociated area of research into an evolutionary or ecological perspective; etc. In all the categories described, the decisive consideration for eligibility will be the desirability of Commentary for the submitted material. Controversial simplicity is not a sufficient criterion for soliciting Commentary: a paper may be controversial simply because it challenges the status quo. Nor is the mere presence of disciplinary aspects sufficient: general cybernetic and “organismic” disquisitions are not appropriate for BBS. Some appropriate rationales for seeking Open Peer Commentary would be that: (1) the material bears in a significant way on some current controversial issues in behavioral and brain sciences; (2) its findings substantively contradict some well-established aspects of current research and theory; (3) it criticizes the findings, practices, or principles of an accepted or influential line of work; (4) it unifies a substantial established aspects of current research and theory; (3) it criticizes the findings, practices, or principles of an accepted or influential line of work; (4) it unifies a substantial established aspects of current research and theory; (3) it criticizes the findings, practices, or principles of an accepted or influential line of work; (4) it unifies a substantial established aspects of current research and theory; (3) it criticizes the findings, practices, or principles of an accepted or influential line of work; (4) it unifies a substantial established aspects of current research and theory; (3) it criticizes the findings, practices, or principles of an accepted or influential line of work; (4) it unifies a substantial established aspects of current research and theory; (3) it criticizes the findings, practices, or principles of an accepted or influential line of work; (4) it unifies a substantial established aspects of current research and theory; (3) it criticizes the findings, practices, or principles of an accepted or influential line of work; (4) it unifies a substantial established aspects of current research and theory; (3) it criticizes the findings, practices, or principles of an accepted or influential line of work; (4) it unifies a substantial established aspects of current research and theory; (3) it criticizes the findings, practices, or principles of an accepted or influential line of work; (4) it unifies a substantial established aspects of current research and theory; (3) it criticizes the findings, practices, or principles of an accepted or influential line of work; (4) it unifies a substantial established aspects of current research and theory; (3) it criticizes the findings, practices, or principles of an accepted or influential line of work; (4) it unifies a substantial.
