The Clementine Atlas of the Moon

Ben Bussey and Paul Spudis

The highly successful Clementine mission to the Moon in 1994 gave scientists their first global look at the Moon. This atlas is based on the data and covers the entire Moon in 144 Lunar Astronautical Charts (LACs). It represents the most complete lunar nomenclature database in existence, listing virtually all named craters and other features. The first atlas to show the entire lunar surface in uniform scale and format, a section of colour plates shows lunar composition and physical properties. The atlas also includes a brief history of lunar science and exploration. *The Clementine Atlas of the Moon* will appeal to both professional planetary and space scientists, and serious amateur astronomers.
