<i>Preface</i>	<i>page</i>	xi
1 Introduction		1
Introduction		1
1.1 Process and pattern		2
1.2 Spatial pattern: spatial dependence versus spatial autocorrelation		6
1.3 The concept of stationarity		11
1.4 Sampling		13
1.4.1 Ecological data		14
1.4.2 Sampling design		18
1.5 Spatial statistics		25
1.5.1 Significance testing of ecological data		26
1.6 Concluding remarks		30
2 Spatial analysis of population data		32
Introduction		32
2.1 Mapped point data in two dimensions		33
2.1.1 Distance to neighbours methods		33
2.1.2 Refined nearest neighbour analysis		35
2.1.3 Second-order point pattern analysis		37
2.1.4 Bivariate data		43
2.1.5 Multivariate point pattern analysis		47
2.2 Mark correlation function		55
2.3 Networks of events		57
2.4 Network analysis of areal units		64
2.5 Point patterns in other dimensions		75
2.5.1 One dimension		75
2.5.2 Three or more dimensions		81
2.6 Contiguous units analysis		82

viii	<i>Contents</i>	
	2.6.1 Quadrat variance methods	82
	2.6.2 Significance tests for quadrat variance methods	85
	2.6.3 Adaptations for two or more species	88
	2.6.4 Two or more dimensions	91
	2.6.5 Spectral analysis and related techniques	95
	2.6.6 Wavelets	96
	2.7 Circumcircle methods	98
	2.7.1 Univariate analysis	99
	2.7.2 Bivariate analysis	100
	2.7.3 Multivariate analysis	103
	2.8 Concluding remarks	103
3	Spatial analysis of sample data	111
	Introduction	111
	3.1 How to determine 'nearby' relationships among sampling units	113
	3.2 Join count statistics	118
	3.2.1 Considerations and other join count statistics	120
	3.3 Global spatial statistics	122
	3.3.1 Spatial autocorrelation coefficients for one variable	124
	3.3.2 Variography	132
	3.3.3 Fractal dimension	139
	3.3.4 Sampling design effects on the estimation of spatial pattern	142
	3.3.5 Spatial relationship between two variables	147
	3.3.6 Spatial relationships among several variables	147
	3.4 Local spatial statistics	153
	3.5 Interpolation and spatial models	159
	3.5.1 Proximity polygons	160
	3.5.2 Trend surface analysis	161
	3.5.3 Inverse distance weighting	164
	3.5.4 Kriging	165
	3.6 Concluding remarks	170
4	Spatial partitioning of regions: patch and boundary	174
	Introduction	174
	4.1 Patch identification	175
	4.1.1 Patch properties	175
	4.1.2 Spatial clustering	176
	4.1.3 Fuzzy classification	180
	4.2 Boundary delineation	184
	4.2.1 Ecological boundaries	184
	4.2.2 Boundary properties	184

<i>Contents</i>		ix
4.2.3	Boundary detection based on several variables	186
4.2.4	Boundary statistics	199
4.2.5	Overlap statistics	202
4.2.6	Boundary detection based on one variable	205
4.3	Concluding remarks	210
5	Dealing with spatial autocorrelation	212
	Introduction	212
5.1	Solutions	221
5.1.1	Quick fixes	221
5.1.2	Adjusting the effective sample size	222
5.1.3	Other kinds of models	229
5.1.4	Particular examples	234
5.1.5	Restricted randomization and bootstrap	239
5.1.6	Model and Monte Carlo	242
5.2	More on induced autocorrelation and the relationships between variables	243
5.3	Models and reality	247
5.4	Considerations for sampling and experimental design	248
5.4.1	Sampling	248
5.4.2	Experimental design	253
5.5	Concluding remarks	254
6	Spatio-temporal analysis	256
	Introduction	256
6.1	Change in spatial statistics	261
6.2	Spatio-temporal join count	263
6.3	Spatio-temporal analysis of clusters and contagion	266
6.4	Polygon change analysis	269
6.5	Analysis of movement	274
6.6	Process and pattern	291
6.6.1	Tree regeneration, growth and mortality	291
6.6.2	Plant mobility	292
6.6.3	Lichen boundaries	293
6.7	Spatio-temporal orderliness and spatial synchrony	299
6.8	Chaos	305
6.9	Concluding remarks	315
6.9.1	Recommendations	316
7	Closing comments and future directions	317
	Back to basics	317
7.1	Programming skills	320
7.2	Stationarity	320

x	<i>Contents</i>	
	7.3 Null hypotheses	322
	7.4 Numerical solutions	323
	7.5 Statistical difficulties	325
	7.6 Randomization and restricted randomization tests	326
	7.7 Complementarity of methods	328
	7.8 Future work	333
	<i>Appendices</i>	336
	<i>References</i>	338
	<i>Index</i>	358
