Preface	<i>page vii</i>
1 Introduction	1
1.1 The Schrödinger equation	1
1.2 Atomic units	3
1.3 The variation principle	5
1.4 Matrix representation of the Schrödinger equation	8
1.5 Perturbation theory	9
2 Symmetry	13
2.1 Introduction	13
2.2 Group theory	13
2.3 Group theory and the Schrödinger equation	22
2.4 Projection operators	23
2.5 Electron permutation symmetry. The Pauli principle	24
2.6 Spatial symmetry	27
2.7 Spin symmetry	34
3 The orbital approximation	37
3.1 Introduction	37
3.2 Hartree–Fock theory	40
3.3 The restricted Hartree–Fock model	48
3.4 Koopmans’ theorem	53
3.5 Brillouin’s theorem	55
3.6 Unrestricted and extended Hartree–Fock models	57
4 Beyond the orbital approximation	62
4.1 Electron correlation	62
4.2 Configuration interaction	65
4.3 Perturbative treatment of electron correlation	67
4.4 Electron correlation in methane and fluorine	73
4.5 Relativistic corrections	76

Table of Contents

[More information](#)*Contents*

5	Representation of the orbitals	<i>page</i> 80
5.1	Matrix formulation of Hartree–Fock theory	80
5.2	Atomic orbitals	83
5.3	The LCAO–MO method	85
5.4	Slater-type molecular orbitals	86
5.5	Gaussian-type molecular orbitals	88
5.6	The minimal basis	95
5.7	Double-zeta and extended bases	98
5.8	Excited states	101
5.9	The floating spherical Gaussian orbital model	107
6	The electron distribution	111
6.1	The one-electron density function	111
6.2	One-electron properties	117
6.3	Charge-density maps	121
6.4	Localized orbitals	129
6.5	Population analysis	148
6.6	Orbital energies and atomic charges	159
7	The chemical bond	169
7.1	The virial theorem	169
7.2	Delocalization and contraction	171
7.3	Conformational changes	188
