 CONTENTS

	<i>page</i>
<i>Preface</i>	ix
1 The biological setting	1
Natural observations and laboratory experiments	4
Hypometabolism, a strategic retreat	7
Reduced metabolic rate during diving	12
2 Metabolic conservation by cardiovascular adjustments	14
Historical introduction	14
Diving bradycardia	16
Cardiac output	20
Arterial pressure	21
Blood flow	23
Venous structure and function	27
3 Cellular tolerances and adaptations to asphyxia	30
Survival considerations	30
Resistance of organs and tissues to asphyxia	31
Circulatory control of metabolism? Its possible role in asphyxial defence	48
The priority of asphyxial defence	49
Biochemical adaptations	53
4 Human divers	60
Historical background	60
Maximum diving ability	62
Morphological and physiological adaptations	63
Cardiovascular responses to diving	65
Functional significance of the diving response	71
5 Control mechanisms	74
<i>Diving ducks and seals</i>	75
Upper respiratory tract reflexes	77

Table of Contents

[More information](#)*Contents*

Sinus arrhythmia	79
Chemoreceptor reflexes	80
Lung inflation and related reflexes	85
Arterial baroreceptor reflexes	86
Reflex interactions	88
Higher cerebral influences	91
<i>Human studies</i>	92
Face immersion	92
Cessation of breathing	96
Depth of dive, intrathoracic pressure, venous return	97
Lung volume	98
Baroreceptors	98
Chemoreceptors	99
Cardiovascular controls	101
Higher centres and general anaesthesia	102
Diving experience, physical fitness and age	102
6 Perinatal asphyxia and survival	104
Fetal and neonatal resistance to asphyxia	104
Diving seals and fetal lambs	106
The pregnant marine mammal	109
7 Medical implications	115
Near-drowning	115
Sudden underwater deaths	120
Asphyxia in new-born humans	122
Sudden infant death syndrome	122
Potentially hazardous conditions	126
The diving response in clinical applications	126
Myocardial ischaemia	127
<i>References</i>	130
<i>Index</i>	165
