<i>Foreword</i>	<i>page</i> ix
<i>Preface</i>	xi
1 The foundations of chemical equilibrium computation	
1.1 Prologue	1
1.1.1 The history of equilibrium computation	1
1.1.2 Applications of equilibrium calculations	4
1.2 Thermodynamics of chemical equilibria	7
1.2.1 Introduction	7
1.2.2 Dalton's Law	7
1.2.3 Entropy and Gibbs free energy of gas mixtures	8
1.2.4 Chemical equilibrium conditions	9
1.2.5 Chemical potentials	11
1.2.6 Equations of reaction equilibrium	12
1.3 Heterogeneous systems	14
1.3.1 Introduction	14
1.3.2 Derivation of the Phase Rule	15
1.3.3 Utilization of the Phase Rule	18
1.4 Non-ideal gases and gas mixtures	21
1.4.1 Equation of state	21
1.4.2 Fugacities	24
1.4.3 Thermodynamic excess functions	25
1.5 Thermodynamic data	26
1.6 Computation of chemical equilibria	31
1.6.1 Existence and uniqueness of solutions	31
1.6.2 Thermodynamic variables	32

2	Mathematical structure of the chemical equilibrium problem	
2.1	Introduction	<i>page</i> 36
2.2	The minimization form: <i>Ideal gases at constant temperature and pressure</i>	37
2.3	The mass action equation approach	39
2.4	The inclusion of pure condensed species	43
2.5	The effect of variations in the temperature and pressure	47
2.6	The effect of changes in parameter on the solution	48
3	Methods based on optimization techniques	
3.1	Introduction	54
3.2	General methods	55
3.2.1	Pattern search method	55
3.2.2	Unconstrained optimization method	59
3.2.3	Linear programming method	61
3.3	Steepest descent methods	63
3.3.1	First-order method	64
3.3.2	Second-order method	69
3.4	Miscellaneous methods	75
3.4.1	Gradient method	76
3.4.2	Survey method	79
3.5	The general literature on optimization	85

CONTENTS

vii

4	Methods based on the solution of non-linear equations	
4.1	Introduction	<i>page</i> 87
4.2	Brinkley's method	88
4.2.1	Principle of the method	88
4.2.2	Newton–Raphson solution	92
4.2.3	Inclusion of condensed phases	95
4.2.4	Non-ideality considerations	96
4.3	The NASA method	98
4.3.1	Principle of the method	98
4.3.2	Assignment of thermodynamic variables	102
4.3.3	Modifications of the NASA method	103
4.4	Trial and error methods	105
4.4.1	Component reduction method	106
4.4.2	Sliding target method	109
4.5	The method of successive reaction adjustments	110
4.5.1	Principle of the method	110
4.5.2	Approximations	112
4.5.3	The optimized basis of components	113
4.5.4	The Cruise–Villars method	114
4.6	The method of nested iterations	115
4.7	Miscellaneous methods	120
4.7.1	Brute force methods	121
4.7.2	Reduction to one or two equations	123
4.8	Methods using element potentials	124

5	General considerations and conclusions	
5.1	Starting estimates	<i>page</i> 128
5.1.1	Estimation procedures	128
5.1.2	Inclusion of condensed species	132
5.2	The convergence of numerical methods of solution	134
5.2.1	Introduction	134
5.2.2	Pure iteration solution	134
5.2.3	Newton–Raphson method	137
5.2.4	Differential equations solution	139
5.3	Consideration of condensed phases and of non-ideality	140
5.3.1	Inclusion of condensed species	141
5.3.2	Treatment of non-ideality	145
5.4	The effect of errors in the thermodynamic data	146
5.4.1	Introduction	146
5.4.2	The second minimization approach	147
5.5	The comparison of computational methods	149
5.5.1	Introduction	149
5.5.2	Comparison of computational speeds	150
5.5.3	Summary of properties	153
	Appendix 1: <i>The method of Lagrangian Multipliers</i>	158
	Appendix 2: <i>Nomenclature</i>	159
	<i>Bibliography</i>	163
	<i>Author index</i>	172
	<i>Subject index</i>	174
