

A COURSE IN ENVIRONMENTAL ECONOMICS

Theory, Policy, and Practice

This unique graduate textbook offers a compelling narrative of the growing field of environmental economics that integrates theory, policy, and empirical topics. Authors Daniel J. Phaneuf and Till Requate present both traditional and emerging perspectives, incorporating cutting-edge research in a way that allows students to easily identify connections and common themes. Their comprehensive approach gives instructors the flexibility to cover a range of topics, including important issues – such as tax interaction, environmental liability rules, modern treatments of incomplete information, technology adoption and innovation, and international environmental problems – that are not discussed in other graduate-level texts. Numerous data-based examples and end-of-chapter exercises show students how theoretical and applied research findings are complementary, and will enable them to develop skills and interests in all areas of the field. Additional data sets and exercises can be accessed online, providing ample opportunity for practice.

Daniel J. Phaneuf is Professor of Agricultural and Applied Economics at the University of Wisconsin-Madison. He has been Managing Editor of the *Journal of Environmental Economics and Management*, and is currently Editor in Chief of the *Journal of the Association of Environmental and Resource Economists*. He is a member of the US Environmental Protection Agency Science Advisory Board and also serves on the board of directors for the Association of Environmental and Resource Economists. His many research articles have appeared in top field and general economics outlets, and he has won awards for his graduate and undergraduate teaching in environmental economics and econometrics.

Till Requate is Professor for Economic Policy at Kiel University, Germany. He was previously Professor for Environmental Economics and Director of the Interdisciplinary Institute of Environmental Economics at Heidelberg University. He is currently Managing Editor of the *Journal of Environmental Economics and Management* and Associate Editor of *Resource and Energy Economics*, and was Chairman of the German Association of Environmental and Resource Economists. He won the European Association of Environmental and Resource Economists' Erik Kempe Award for the best paper in 2004 and the German Society of Health Economics' best paper award in 2013. His research articles have appeared in top field and general economics outlets.

PART I ECONOMICS AND THE ENVIRONMENT

1	Environmental Economics and the Theory of Externalities	3
1.1	Market Failures	4
1.2	Descriptive Explanation of Market Failure	6
1.3	A Formal Model of Externalities	7
	1.3.1 <i>Pareto Optimality</i>	8
	1.3.2 <i>The Competitive Market</i>	9
	1.3.3 <i>Market Intervention</i>	11
1.4	Points Going Forward	12
1.5	Summary	14
1.6	Further Reading	15
	Exercises	15
2	Environmental Problems and Policy Issues	17
2.1	Evolution of Environmental Policy and Economics	17
2.2	Major Pollutants and Pollution Problems	21
	2.2.1 <i>Water Pollution</i>	21
	2.2.2 <i>Air Pollution</i>	23
	2.2.3 <i>Land Pollution</i>	26
	2.2.4 <i>Pollution Problems and Economics</i>	27
2.3	Economics and Ecology	28
2.4	Policy Examples	29
	2.4.1 <i>Sulfur Dioxide</i>	29
	2.4.2 <i>Nutrient Surface Water Pollution in the US</i>	30
	2.4.3 <i>Hazardous Waste in the US</i>	31
	2.4.4 <i>Climate</i>	32

2.5	Summary	34
2.6	Further Reading	34
3	Introduction to the Theory of Environmental Policy	35
3.1	A Simple Model of Damages and Costs	35
3.1.1	<i>Damage Function</i>	36
3.1.2	<i>Abatement Costs</i>	36
3.1.3	<i>Efficient Allocation</i>	37
3.2	Property Rights and the Coase Theorem	39
3.2.1	<i>Household Ownership of Pollution Rights</i>	39
3.2.2	<i>Firm Ownership of Pollution Rights</i>	40
3.2.3	<i>Coase Theorem</i>	40
3.2.4	<i>Comments on the Polluter Pays Principle</i>	41
3.3	Environmental Policy Instruments	44
3.3.1	<i>Command and Control</i>	44
3.3.2	<i>Emission Taxes</i>	46
3.3.3	<i>Auctioned Pollution Permits</i>	48
3.3.4	<i>Freely Distributed Transferable Permits</i>	49
3.3.5	<i>Subsidies</i>	52
3.4	Aggregate Marginal Abatement Cost Curve	53
3.5	Summary	54
3.6	Further Reading	55
	Exercises	56
PART II THE DESIGN OF ENVIRONMENTAL POLICY		
4	Imperfect Information	61
4.1	Price Versus Quantities	62
4.1.1	<i>Damage Function Uncertainty</i>	62
4.1.2	<i>Abatement Cost Function Uncertainty</i>	63
4.1.3	<i>Weitzman Theorem</i>	65
4.1.4	<i>Contemporary Policy and Research Relevance</i>	69
4.2	Hybrid Policies	70
4.2.1	<i>Safety Valves</i>	70
4.2.2	<i>Approximating the Marginal Damage Curve</i>	73
4.3	Mechanism Design	75
4.3.1	<i>Kwerel's Mechanism</i>	76
4.3.2	<i>Montero's Mechanism</i>	77
4.3.3	<i>Second-Best Mechanism Design</i>	82
4.4	Summary	86
4.5	Further Reading	87
	Appendix A: Derivation of Weitzman Theorem Result	88
	Appendix B: Characterization of Optimal Second-Best Solution	90
	Exercises	90
5	Competitive Output Markets	94
5.1	Model Extension	95
5.1.1	<i>Cost Functions</i>	95

Contents		ix
	5.1.2 <i>Market Demand</i>	97
	5.1.3 <i>Welfare and Social Optimum</i>	99
5.2	Environmental Policy Instruments	100
	5.2.1 <i>Taxes</i>	101
	5.2.2 <i>Permits and Other Instruments</i>	104
5.3	Standards Reconsidered	108
5.4	Long Run Optimality of Environmental Policy Instruments	111
	5.4.1 <i>Long Run Social Optimum</i>	111
	5.4.2 <i>Standards</i>	112
	5.4.3 <i>Taxes</i>	113
	5.4.4 <i>Auctioned and Freely Distributed Permits</i>	114
	5.4.5 <i>Subsidies</i>	115
5.5	An Expanded Examination of Abatement Costs	116
5.6	Summary	119
5.7	Further Reading	120
	Appendix: Proof of Proposition 5.3	120
	Exercises	121
6	Non-Competitive Output Markets	124
6.1	Monopoly	125
	6.1.1 <i>Taxation When Abatement is Not Possible</i>	125
	6.1.2 <i>Taxation When Abatement is Possible</i>	128
	6.1.3 <i>Regulating Output and Emissions Simultaneously</i>	130
6.2	Oligopolies	131
	6.2.1 <i>Firm Behavior Under Emission Taxes in a Cournot Model</i>	131
	6.2.2 <i>Regulator's Problem Under Cournot Oligopoly</i>	133
	6.2.3 <i>Entry and Exit</i>	135
6.3	Extensions	137
6.4	Summary	138
6.5	Further Reading	139
	Exercises	139
7	Environmental Policy with Pre-existing Distortions	142
7.1	Extending the Model	143
	7.1.1 <i>Optimum with No Labor Market Distortion</i>	145
	7.1.2 <i>A Labor Market Distortion</i>	146
7.2	Second-Best Optimal Pollution Levels	148
	7.2.1 <i>Non-revenue Raising Environmental Policy</i>	148
	7.2.2 <i>Revenue Raising Environmental Policy</i>	154
	7.2.3 <i>Prospects for a Double Dividend?</i>	159
	7.2.4 <i>Second-Best Optimal Pollution</i>	160
7.3	An Extended Example	161
	7.3.1 <i>Setting an Environmental Standard</i>	162
	7.3.2 <i>Setting an Emission Tax</i>	163
	7.3.3 <i>A Numerical Example</i>	164
7.4	Policy Instruments	165

7.4.1	<i>Taxes and Auctioned Permits</i>	165
7.4.2	<i>Freely Distributed Permits and Command and Control</i>	166
7.4.3	<i>Subsidies</i>	167
7.5	Generalizations and Empirical Evidence	167
7.5.1	<i>A Generalization</i>	167
7.5.2	<i>Empirical Research and Policy Implications</i>	169
7.6	Summary	170
7.7	Further Reading	171
	Exercises	172
8	Institutional Topics in Cap and Trade Programs	175
8.1	The Spatial Dimension	176
8.1.1	<i>A Spatial Pollution Model</i>	176
8.1.2	<i>Decentralization</i>	177
8.2	The Temporal Dimension	178
8.2.1	<i>A Two-Period Model</i>	179
8.2.2	<i>Should Banking Be Allowed?</i>	180
8.3	Market Power	182
8.4	Transaction Costs	187
8.4.1	<i>Modeling Transaction Costs</i>	187
8.5	Initial Allocation Schemes	191
8.5.1	<i>Closed Trading Systems</i>	192
8.5.2	<i>Open Trading Systems</i>	195
8.6	Overlapping Regulations	196
8.6.1	<i>Permit Trading and Emission Taxes</i>	196
8.6.2	<i>Emission Trading and Emission Policies</i>	197
8.7	Monitoring and Compliance	198
8.7.1	<i>A Simple Model with Monitoring and Punishment</i>	198
8.7.2	<i>Incremental Punishment and Costly Monitoring</i>	199
8.7.3	<i>Second-Best Optimal Inspection Policy with Costly Inspection</i>	200
8.7.4	<i>Compliance and Monitoring Under Cap and Trade</i>	201
8.8	Summary	203
8.9	Further Reading	205
	Appendix: An Example of Beneficial and Harmful Banking	205
	Exercises	207
9	Ambient Pollution Control	212
9.1	Deterministic Non-point Source Pollution	213
9.2	Stochastic Ambient Pollution	215
9.2.1	<i>The Constrained Social Optimum</i>	216
9.2.2	<i>Decentralization of the Social Optimum</i>	219
9.2.3	<i>Uniform Tax</i>	222
9.2.4	<i>When Firms Can Observe their Idiosyncratic Shocks</i>	223
9.2.5	<i>When Firms Have Several Choices</i>	224
9.2.6	<i>Non-linear Tax Scheme</i>	224
9.3	Other Approaches	225

Contents	xi
9.4 Policy and Experimental Evidence	226
9.5 Summary	228
9.6 Further Reading	229
Appendix A: Second-Best Optimal Firm-Specific Taxes with Multiple Inputs	229
Appendix B: Derivation of (9.39)	231
Exercises	231
10 Liability	234
10.1 Basic Model	235
10.2 Liability Rules for a Solvent Firm	238
10.2.1 <i>Strict Liability</i>	238
10.2.2 <i>Negligence Rule</i>	239
10.3 Liability Rules for a Judgment-Proof Firm	240
10.3.1 <i>Strict Liability</i>	241
10.3.2 <i>Negligence Rule</i>	243
10.4 Liability Rules If Insurance is Available	244
10.4.1 <i>Risk Neutrality</i>	245
10.4.2 <i>Risk Aversion</i>	246
10.4.3 <i>Compulsory Insurance</i>	251
10.4.4 <i>Lender Liability</i>	253
10.5 Alternative Causality	254
10.5.1 <i>Model Extension</i>	254
10.5.2 <i>Proportional Liability</i>	255
10.5.3 <i>Collective Liability</i>	256
10.5.4 <i>Costly Monitoring</i>	256
10.6 Multi-causality	257
10.7 Examples of Environmental Liability Laws	258
10.8 Summary	260
10.9 Further Reading	261
Appendix A: Proof of Proposition 10.5	262
Appendix B: Proof of Proposition 10.6	262
Appendix C: Proof of Proposition 10.7	263
Exercises	264
11 Innovation and Adoption of New Technology	267
11.1 The Private Innovation Model	268
11.1.1 <i>Decentralized Decisions</i>	269
11.2 Investment Spillovers	270
11.2.1 <i>Second-Best Optimal Environmental Policy</i>	271
11.3 Discrete Adoption Decisions	272
11.3.1 <i>Additional Model Features</i>	272
11.3.2 <i>Adoption Incentives Under Different Policy Instruments</i>	274
11.3.3 <i>Ranking of Policy Instruments</i>	279
11.3.4 <i>The Socially Optimal Degree of Technology Adoption</i>	282
11.3.5 <i>Decentralization of Optimal Solution</i>	285
11.4 Environmental R&D and Licensing	288

11.4.1	<i>Value of a General Process Innovation</i>	289
11.4.2	<i>A Model of R&D</i>	290
11.4.3	<i>A Model of Environmental Innovation</i>	291
11.5	A Comprehensive Model of R&D and Technology Adoption	293
11.5.1	<i>Socially Optimal Allocation</i>	294
11.5.2	<i>Decentralized Decision-Making and First-Best Regulation</i>	295
11.5.3	<i>Second-Best Analysis: Environmental Policy Only</i>	297
11.6	Experimental evidence	303
11.7	Summary	304
11.8	Further Reading	306
	Appendix A: Derivation of (11.92)	307
	Appendix B: Ex Ante Regulation After R&D and Technology Pricing	307
	Appendix C: Simultaneous Decisions on the Tax Rate and Technology Price	309
	Appendix D: Derivation of (11.101)	310
	Exercises	310
12	International Environmental Problems	313
12.1	Transboundary Pollution in an Autarky Model	315
12.1.1	<i>Model</i>	315
12.1.2	<i>Non-cooperative Behavior</i>	316
12.1.3	<i>Cooperative Behavior</i>	316
12.2	Commodity Transfer	318
12.3	Multiple Commodities and Proper Trade	321
12.3.1	<i>Model Extension</i>	322
12.3.2	<i>Efficient Allocation</i>	322
12.3.3	<i>Unilateral Environmental Policy in a Small Open Economy</i>	324
12.4	Large Open Economies	325
12.4.1	<i>Optimal Unilateral Policy with a Foreign Emission Tax</i>	326
12.4.2	<i>Optimal Unilateral Policy with a Foreign Emission Standard</i>	330
12.4.3	<i>Internationally Mobile Factors</i>	332
12.4.4	<i>Separation of Instruments</i>	332
12.5	Imperfect Competition and Environmental Dumping	333
12.5.1	<i>Extension of the Basic Model to Imperfect Competition</i>	334
12.6	Interactions with Energy Markets	336
12.6.1	<i>Model Adjustments</i>	336
12.6.2	<i>Spatial Leakage</i>	337
12.6.3	<i>Intertemporal Leakage and the Green Paradox</i>	338
12.7	International Coalition Formation	340
12.8	Kyoto Mechanisms: JI and CDM	341
12.9	Does Trade Liberalization Induce More or Less Pollution?	344
12.9.1	<i>A Stylized Ricardian Model</i>	344
12.10	Summary	347
12.11	Further Reading	348

Contents	xiii
Appendix: Proof of Proposition 12.2	349
Exercises	351
13 Accumulating Pollutants	353
13.1 The Accumulating Pollutant Cost-Damage Model	354
13.1.1 <i>Stock Dynamics</i>	354
13.1.2 <i>Abatement Cost and Damage</i>	354
13.2 Dynamic Optimality	355
13.2.1 <i>Discrete Time</i>	355
13.2.2 <i>Continuous Time</i>	357
13.2.3 <i>The Steady State</i>	358
13.2.4 <i>Optimal Path to the Steady State</i>	360
13.2.5 <i>Phase Diagrams</i>	361
13.2.6 <i>Policy Instruments and Decentralized Decision-Making</i>	367
13.2.7 <i>Final Remarks</i>	368
13.3 Exhaustible Resources and Pollution Control	368
13.3.1 <i>Pure Resource Extraction Model</i>	369
13.3.2 <i>Optimal Extraction of a Polluting Resource</i>	371
13.4 Summary	375
13.5 Further Reading	376
Appendix A: Introduction to the Calculus of Optimal Control	376
Appendix B: Linear Marginal Damage and Marginal Abatement Cost Curves	379
Appendix C: Proof of Proposition 13.1	381
Exercises	386
PART III VALUING THE ENVIRONMENT	
14 Theory of Applied Welfare Analysis	391
14.1 General Setup	392
14.2 Price Change Welfare Measures	394
14.2.1 <i>Compensating and Equivalent Variation</i>	394
14.2.2 <i>Consumer Surplus</i>	398
14.2.3 <i>Towards Measurement</i>	402
14.3 Quantity Change Welfare Measures	405
14.3.1 <i>Compensating and Equivalent Variation</i>	406
14.3.2 <i>The Fundamental Challenge of Measurement</i>	409
14.4 WTP and WTA	410
14.5 Welfare Analysis Under Uncertainty	413
14.6 Summary	416
14.7 Further Reading	417
Exercises	418
15 Revealed Preference Models	420
15.1 The Fundamental Challenge Revisited	421
15.1.1 <i>A Direct Approach</i>	422
15.1.2 <i>An Indirect Approach</i>	423
15.1.3 <i>Why Revealed Preference?</i>	424

15.2	Complements	425
	15.2.1 <i>Ordinary Demand Functions</i>	427
	15.2.2 <i>Specifying Ordinary Demand Equations</i>	431
	15.2.3 <i>Application Preview</i>	434
15.3	Substitutes	434
	15.3.1 <i>Technology and Behavior</i>	435
	15.3.2 <i>Exact Welfare Measures</i>	438
	15.3.3 <i>Bounding Results</i>	440
	15.3.4 <i>Application Preview</i>	441
15.4	Quality-Differentiated Market Goods	442
	15.4.1 <i>Hedonic Model</i>	443
	15.4.2 <i>Application Preview</i>	448
15.5	Summary	449
15.6	Further Reading	450
	Appendix A: Proof of Proposition 15.2	450
	Appendix B: Proof of Proposition 15.3	453
	Appendix C: Proof of Proposition 15.4	454
	Exercises	455
16	Discrete Choice Models	457
16.1	Conceptual Basis	458
	16.1.1 <i>Theoretical Discrete Choice Model</i>	458
	16.1.2 <i>Towards an Empirical Model</i>	460
	16.1.3 <i>A Running Example</i>	461
16.2	Basic Econometrics	462
	16.2.1 <i>Conditional Logit Model</i>	463
	16.2.2 <i>Specification</i>	464
16.3	Identification	468
16.4	Features of the Logit Model	472
16.5	Advanced Econometrics	473
16.6	Welfare Computation	477
	16.6.1 <i>The Linear in Parameters Logit Model</i>	477
	16.6.2 <i>The Role of Income</i>	479
16.7	Summary	480
16.8	Further Reading	482
	Exercises	482
17	Recreation	485
17.1	Theoretical Model	487
	17.1.1 <i>Underlying Assumptions</i>	488
	17.1.2 <i>Some Generalizations</i>	489
17.2	Data Structures	491
	17.2.1 <i>A Running Example</i>	492
17.3	Empirical Models	493
	17.3.1 <i>Demand Systems</i>	494
	17.3.2 <i>RUM Models</i>	499
	17.3.3 <i>Corner Solution Models</i>	506

Contents		xv
	<i>17.3.4 Summary of Empirical Models</i>	514
17.4	Modeling Issues	514
	<i>17.4.1 Choice Set Definition</i>	515
	<i>17.4.2 Opportunity Cost of Time</i>	517
	<i>17.4.3 Onsite Time</i>	521
	<i>17.4.4 Dynamics</i>	523
17.5	Summary	524
17.6	Further Reading	525
	Exercises	525
18	Property Value Models	529
18.1	Hedonic Property Value Models: Theory	530
	<i>18.1.1 Consumer's Choice Problem</i>	531
	<i>18.1.2 A Running Example</i>	536
18.2	Hedonic Property Value Models: Welfare Measurement	536
	<i>18.2.1 Localized Changes in Quality</i>	537
	<i>18.2.2 General Equilibrium Effects</i>	539
18.3	Hedonic Property Value Models: Estimation	541
	<i>18.3.1 First Stage Estimation</i>	541
	<i>18.3.2 Second Stage Estimation</i>	546
18.4	Structural Models	552
	<i>18.4.1 Discrete Choice Models</i>	553
	<i>18.4.2 Sorting Models</i>	556
	<i>18.4.3 Advantages and Disadvantages of a Structural Approach</i>	560
18.5	Quasi-experimental Approaches	561
	<i>18.5.1 Background and Motivation</i>	561
	<i>18.5.2 Alternative Identification Strategies</i>	564
	<i>18.5.3 Structural Versus Quasi-experimental Analysis</i>	567
18.6	Summary	568
18.7	Further Reading	570
	Exercises	570
19	Stated Preference Methods	572
19.1	Stated Preference Approaches	574
	<i>19.1.1 Contingent Valuation Method</i>	576
	<i>19.1.2 Discrete Choice Experiments</i>	579
	<i>19.1.3 Contingent Behavior</i>	582
19.2	Empirical Models for Stated Preference Data	583
	<i>19.2.1 Binary Choice</i>	583
	<i>19.2.2 Discrete Choice Experiments</i>	589
19.3	Incentive Properties of Stated Preference Surveys	592
	<i>19.3.1 Incentive Properties of CVM</i>	593
	<i>19.3.2 Incentive Properties of Discrete Choice Experiments</i>	595
19.4	Validity	596
	<i>19.4.1 Criterion Validity</i>	597
	<i>19.4.2 Convergent Validity</i>	599

19.4.3	<i>Construct Validity</i>	600
19.4.4	<i>Content Validity</i>	601
19.5	Best Practice and Experimental Design	603
19.5.1	<i>Best Practice</i>	604
19.5.2	<i>Experimental Design</i>	607
19.6	Combining SP and RP Data	609
19.6.1	<i>Methodological Topics</i>	609
19.6.2	<i>When Should RP and SP Data Be Combined?</i>	611
19.7	Summary	612

Preface

This book grew out of discussions we had more than ten years ago, when we were both teaching graduate courses in environmental economics at our respective universities in Germany and the United States. Though our interests and skills were different – Requate is a theorist/experimentalist, and Phaneuf an empiricist – we both had the sense that there was something missing in the textbooks we used for our classes. Specifically, while there are a variety of excellent undergraduate and some Master’s-level textbooks, there was not a single obvious choice for instructors teaching at the advanced graduate level. For environmental policy design, the classic book by Baumol and Oates (1988), *The Theory of Environmental Policy*, had become dated. For non-market valuation, Freeman (2003) and Freeman et al. (2014), *The Measurement of Environmental and Resource Values*, was (and remains today) an authoritative and obvious choice, but its emphasis is on concepts rather than empirics. As such, there was no single volume suitable for advanced study that presented the theoretical, empirical, and policy aspects of the field as an integrated narrative. As a result, we felt that our students were seeing the trees but not the forest, i.e. they were learning environmental economics as a collection of disjointed topics, but failing to appreciate how the topics fit together into something greater than the sum of their parts. We felt that a textbook for graduate students was needed that: (a) presented the field’s canon on environmental policy design and non-market valuation using a single notational convention; (b) included contemporary and advanced topics missing in other sources; (c) reflected the increasingly empirical nature of environmental economics; and (d) conveyed the excitement and dynamism of a growing field. This book is our attempt to meet that need.

Our vision for the book is best explained by discussing its organization. We have divided the material into four parts. In Part I, we set the stage by placing environmental economics in its historical context. This is accomplished by reviewing the field’s roots in neoclassical welfare theory and the theory of externalities (Chapter 1), and its close relationship to environmental policy and environmental science (Chapter 2). In Chapter 3 we close Part I by laying out our basic modeling framework for the first half of the book. We define the environmental externality problem and optimal solution, and introduce a variety of environmental policy instruments, which are potentially suitable for decentralizing the social optimum. We also begin to establish criteria that we will

use to evaluate their performance. A main conclusion from Part I is that the portfolio of economic-incentive based policies that we introduce – e.g. emission taxes, cap and trade programs, emission subsidies – are equivalent in their economic efficiency properties.

Our Part I conclusions set up an important benchmark for Part II of the book, in which we add real-world complexity to our description, and investigate the conditions under which the equivalence of the above-mentioned policy tools breaks down. We also study circumstances in which alternative (or complementary) policy instruments are preferred, and when second-best optimal solutions need to be implemented. More specifically, the first several chapters in Part II cover the traditional sub-field of policy design. In Chapters 4 through 9, we consider a range of generalizations and extensions that add nuance to our comparisons of policy instruments. Examples of specific topics include the role of uncertainty in policy design (Chapter 4), considerations related to competitive and non-competitive output markets (Chapters 5 and 6), the role of other, non-environmental distortions in formulating environmental policy (Chapter 7), complications related to spatial considerations and other institutional features (Chapter 8), and the particular problems associated with non-point source pollution (Chapter 9). A common theme in these chapters is that context matters. We show that the equivalence of different economic-incentive based policies holds only in special cases, meaning that effective policy design requires careful consideration of multiple (often competing) factors. These chapters also illustrate how, in its focus on policy-specific challenges, environmental economics has matured beyond an application of the theory of public goods and externalities to the environment.

The last four chapters of Part II cover themes that move beyond the standard suite of policy design topics. For example, in Chapter 10 we provide a detailed treatment of liability rules as an alternative to emission regulations for environmentally risky activities. This is followed in Chapter 11 by a comprehensive discussion of environmental technology development, adoption, and diffusion. In Chapter 12 we discuss several topics that are specific to international environmental problems, including transboundary pollution and international trade. Finally, we close Part II in Chapter 13 by addressing dynamic aspects of externalities – notably models for stock (accumulating) pollutants, and their connection to climate change and non-renewable resource policy.

Throughout Parts I and II of the book, we use conceptual representations of cost and utility functions to characterize policy solutions. Implementation of policy solutions in most instances requires empirical estimates of pollution abatement costs and damage functions, which derive from firms' and households' underlying technology and preference structures. In Part III we turn our attention to the traditional sub-field of non-market valuation, which includes theoretical and empirical tools used to measure the costs and benefits that result from changes in environmental quality. We begin by describing the theoretical basis for applied welfare analysis (Chapter 14), and then discuss the specific assumptions that are needed to calculate non-market values using only observed behavior (Chapter 15). These assumptions give rise to the so-called revealed preference models. In Chapter 16 we present a review of discrete choice econometrics – a class of empirical models that plays a large role in many areas of non-market valuation. These initial Part III chapters provide the conceptual and empirical backgrounds needed for studying the specific techniques and applications that follow. These include recreation demand (Chapter 17), property values (Chapter 18), stated preference methods (Chapter 19), and health valuation (Chapter 20).

We complete the book in Part IV by examining themes related to the practice of environmental economics. Our main task is to discuss, across two chapters, a handful of topics connected to cost-benefit analysis. These include conceptual issues such as discounting and the use of integrated assessment models (Chapter 21), and applied issues related to benefits transfer and estimating abatement cost functions (Chapter 22). We then close the book in Chapter 23 with observations on the increasingly empirical nature of environmental economics, discussions on themes we have not covered, and identification of topics that we believe provide important opportunities for future research.

A distinguishing feature of the book is that we have used a single notational scheme across the four parts of the book in order to connect the various topics and minimize the cost of entry into each new concept. We have also included numerous numbered examples, which we use to describe relevant empirical research, provide intuition with specific functional forms, or place our discussions in the context of a specific policy. A variety of exercises are included at the end of most chapters, which, depending on the chapter's content, are analytical, numerical, empirical, or literature based.¹ In some cases, advanced material or proofs are included in appendices that follow the main content of a chapter. The book's website (www.phaneuf-requate.com) houses data for the empirical exercises as well as supplemental information and errata.

Finally, we have included a "further reading" section at the end of each chapter. It is here that we identify the original source material our discussion has drawn on, and highlight related and in some cases recent research contributions to the area. We have used this approach for two reasons. First, we wrote using a narrative format rather than a review article format, meaning we tried to avoid breaking the flow of description with a large volume of parenthetical references. Thus our citations in the main body of the chapters are usually reserved for attribution of specific ideas, identification of classic sources, and acknowledgment when we have used published material as a model for our textbook presentation. Second, we wanted to have a specific section in each chapter that would serve as a literature-organizing vehicle, where we could classify different areas of inquiry that fit under the chapter's broad themes. We emphasize that our further reading sections are designed to be illustrative rather than comprehensive, and so we have not included citations to many (or even most) of the relevant papers. That said, a book this long that unfolded over many years will undoubtedly have failed to give proper credit in many places, and so the book's website will include expanded versions of our further reading sections, which will be updated periodically.

There are many ways that instructors and students can make use of this book. One possibility is to use the content as the basis for a lecture-based survey of the field. For Master's level survey classes, the early sections in most chapters are accessible and provide the basic canon, while more advanced topics, covered in the later sections, can be skipped. For PhD level survey classes, instructors will have more flexibility to cover the advanced sections and the more technical chapters. A second possibility is to use chapters in the book as background reading for discussion classes focused on contemporary research. For example, students exploring new research at the health-environment nexus may benefit from an initial review of our revealed preference, stated preference, and health valuation chapters. As these different uses suggest, the book does not have

¹ When relevant, the difficulty of individual exercises is indicated using asterisks. One, two, or three asterisks denote basic, intermediate, and advanced problems, respectively.

to be read linearly. A course on environmental policy design could focus on Part I and selected chapters in Part II, while a course on non-market valuation could start directly with Part III and incorporate some material in Part IV. Finally, the book can serve as a reference for the collection of theoretical predictions and empirical methods that environmental economists use in their day-to-day research and teaching.

In terms of technical preparation, readers should have a good understanding of core microeconomic theory. This includes familiarity with consumer demand theory, the theory of the firm, standard duality methods, and general equilibrium concepts. Basic knowledge in game theory, including the concepts of Nash and sub-game perfect equilibria, is useful. In a few instances we use more advanced tools, including mechanism design in Chapter 4 and dynamic optimization in Chapter 13. In these cases we have tried to introduce the needed tools along with the specific concept. Topics that require techniques beyond what is listed above are identified and references provided, but not discussed in detail. Nonetheless, some of the end-of-chapter exercises provide opportunities to explore the advanced areas. For several of the analytical and numerical exercises, familiarity with computational software packages such as Matlab or Mathematica is necessary.

Readers should also have a good understanding of basic econometrics and applied methods. Familiarity with linear regression models and discrete choice econometrics is needed for our applied chapters and to appreciate many of the empirical examples we use throughout. Since discrete choice methods are not always taught in core econometrics classes, we have included a chapter on this subject, which can serve as a point of entry for the interested reader. Experience with applying basic regression and discrete choice models using software tools such as Stata or R is necessary for completing the applied end-of-chapter exercises.

To close the preface, we would like to share a few personal notes and express thanks to the many people and institutions that supported our efforts during the writing of this book. In retrospect, our feeling is that the book was harder to write than expected. Our early plans envisioned translating our respective lecture notes into a narrative, but we quickly discovered that the task of surveying a dynamic and growing field required more than that. As we worked, we became convinced that the book needed to have substantial breadth to represent the range of themes that have occupied environmental economists. At the same time, we did not want to sacrifice depth, since our goal was to provide a genuinely advanced treatment of topics in the field. These two objectives largely explain the book's length and the time it has taken to write. They are also the likely explanations for any limitations that may be present in the final product. Challenging though it was, writing the book was enormously satisfying intellectually, and we are grateful for the opportunity the publisher and our institutions have given us to pursue this work.

A defining characteristic of any multi-year project is that the list of people and organizations to whom thanks is owed is long. We are unable to list here the names of many colleagues and students who read drafts, provided reviews, reacted to ideas, and gave encouragement, but we want to extend our collective thanks for their input. In addition, we have accumulated and presented the ideas in this book, but most of them originated with other people. As such we want to thank the many economists, past and current, who have shaped the field and driven its progress. We also want to acknowledge the authors, reviewers, and publishers of the journals that we have edited during many of our writing

Preface

xxvii

years. Our editing work at *Journal of the Association of Environmental and Resource Economists* (JAERE – Phaneuf) and *Journal of Environmental Economics and Management* (JEEM – Requate/Phaneuf) has complemented our writing by keeping us abreast of the field’s development, expanding our understanding of different topic areas, and introducing us to researchers around the globe.²

We would also like to explicitly recognize the institutions that have supported our efforts: North Carolina State University and University of Wisconsin-Madison (Phaneuf), and University of Heidelberg and University of Kiel (Requate). Phaneuf also acknowledges generous support from the NCSU Kriz Faculty Study Leave Endowment, which partially funded his sabbatical visit at the University of Kiel.

² At the time of writing, Requate is the Managing Editor for *JEEM* and Phaneuf is the Editor in Chief for *JAERE*. Phaneuf served as *JEEM*’s Managing Editor from 2011 through 2013.

Notational Conventions

The following describes the notation conventions that we generally maintain throughout the book.

STRUCTURAL FUNCTIONS

$D(\cdot)$:	Household pollution damage function
$C(\cdot)$:	Firm abatement cost or general cost function
$\Pi(\cdot)$:	Firm profit function
$U(\cdot)$:	Household or individual direct utility function
$V(\cdot)$:	Household or individual indirect utility function
$P(\cdot)$:	Inverse demand function
$E(\cdot)$:	Household expenditure function (also industry emission level; see below)
$f(\cdot), g(\cdot)$:	Technologies

QUANTITIES

x :	Scalar or vector of consumer demand or firm output levels
p :	Scalar or vector of market prices for x
z :	Scalar consumer good or firm output level; often the numeraire good
l :	Scalar or vector of firm factor input levels
w :	Scalar or vector of firm factor input prices. Also used for household wage rate
y :	Household, individual, or firm income level
e :	Firm level pollution emissions
E :	Industry level pollution emissions (also household expenditure function; see above)
q :	Scalar or vector of an environmental good or quality level
s :	Scalar or vector of agent characteristics
<i>Capital letters</i> :	aggregate outcomes
<i>Lower-case letters</i> :	agent level outcomes

Notational Conventions

xxix

BEHAVIORAL FUNCTIONS

- $x(\cdot)$: Ordinary (uncompensated) demand scalar or vector
 $h(\cdot)$: Compensated demand scalar or vector
 $\pi^q(\cdot)$: Compensated inverse demand function for quality
 $\theta^q(\cdot)$: Uncompensated inverse demand function for quality
 $l(\cdot)$: Firm's factor demand function

POLICY PARAMETERS

- τ : Pollution tax
 ζ : Pollution or other subsidy
 σ : Price of a pollution allowance in a pollution rights market
 α : Relative standard
 L : Supply of pollution allowances in a pollution rights market

INDEXES

- $i = 1, \dots, I$: Index of households or individuals
 $j = 1, \dots, J$: Index of firms; also used as index of consumer choice elements in later chapters

OTHER SYMBOLS

- $\varepsilon, \eta, \kappa, \nu$: Parameters of structural, behavioral, or econometric functions. Also used for elasticities or response functions
 ξ : Unobserved attribute of a quality-differentiated consumer good
 β, θ, γ : Symbols commonly used as known or unknown parameters of a model; often the targets of estimation
 ρ : State of the world probability. Also used for consumption discount rate
 π : General probability

PRONOUNS:

- he*: Economic agent
she: Analyst or regulator
it: Firm or household
