INDEX

adaptive cue hypothesis, 127–34; in changing populations, 130–1; cues for female choice, 132; demography, (components) 131–2, (consequences) 133; and fitness, 127–8, 130–1, (costs and benefits) 131; male viability, 127, 128–31, 133–4; measurement of, 129–31; models, 128–31; in stable populations, 128–30
advertisement, 142–4; calls, 183, 189, 196, 200–1; costs and benefits, 142–4; phenotypes, 141–4
age, 363, 370; arrival dates at colony, 362, 363, 370, (of females and males) 371–2; cue for female choice, 124, 132; divorce rate, 365, 366; duration of pair bond, 366, 368; indication by plumage, 16; kin preference, 263n, 264n; and parental care, 438; and productivity, 333, 334–7; scent signal information, 219; survival rate, 365; see also experience; longevity
albatrosses: Diomedea bulleri, Diomedea exulans, Diomedea immutabilis, Diomedea irrorata, 343; divorce rates, D. irrorata, 350–1; foraging efficiency, D. immutabilis, 43; pair bonds, 333, 343, 350
alternative strategies, xiv; behavioural variability, 191–2; choice by females, 192–5, 201; in explosive breeders and prolonged breeders, 184–7; functions, 190–1; in male, of survival, mating and rearing, (maximising mating success) 425–6, (maximising birth rate) 427–9, (maximising fitness) 430, (network of decisions) 431–2; in mate-locating behaviour, 187–90; of reproduction, 423–32
androgens; acquisition of preference, 396–7; action at cellular level, 393; and behaviour, 393, 395; in blood plasma, 392, 394, 396, 401; expression of mate choice, 394–6; and hypothalamic areas, 393; metabolism of, 393; receptiveness in females, 413; scent gland control, 219, 220; secondary sexual characters, 390; sperm production and transport, 393; synchrony between partners, 397–402; target cells in brain, 393; see also individual androgens androstenedione, 391
anuran amphibians, male–male competition and mate choice, 181–20
Argus Pheasant Argusianus argus, 16 aromatase activity, 391, 392, 400–1
Aesulus spp., males: choice for fecundity, 5, 177; guard of female, 161
Aesulus aquaticus, 5
assortative mating (positive assortment), 240–2, 311; among ecotypes, 8; genetic variation, 240, 311; genic covariance, 73, 79; and local adaptations, 236–7, 246; mate choice and reproductive fitness in Snow Geese, 279–95; offspring fitness, 240–2; for quality, 152; recognition of phenotype, 240; in rodents 311; for size, 156, 194, 201–3, (and male density) 202–3; and speciation, 240; species-recognition mechanism, 290–1; see also disassortative mating attractive-ness: of females, 174, 377, 378, 379–80, 408; in feral troops of monkeys, 414; levels between couples, 380; loss of, and compensatory behaviour, 412; of males, 409; non-behavioural, 410–11, 413, 416; and ovarian hormones, 410–11, 416; and pheromones, 411, and testosterone levels in males, 408; see also advertisement auditory stimuli, 316
babblers Turdoides spp., pair bonds and mate replacements, 346–7
Barbet Bird Trachyphonus d'arnaudii, monogamy, 37
bats: dispersion in leks, 116–17; female copying, 125; male dispersion, 112; male dominance, 118; measurement of adaptive cues in, 129; position effect in female choice, 121, 122; predation by, 4 Beagles: oestrus and behaviour, 389–90

© Cambridge University Press www.cambridge.org
beetles: mate choice and wasps, "Chauliognathus pensylvanicus", 20; monogamy in, 40; rare male effect, flour beetle, ladybird, 242.

behaviour: compensatory, for loss of attraction, 412; and deep structure of social group, 414, 416; dominance hierarchies, (defined by aggression) 409, 414, 415, 416, (among females) 407, 413–414, 416, (among males) 407–14, (see also status): effects on hormone secretion, 407–9; evolution of, 59–60; female receptiveness, 413; and hormones, 390, 391–3, 395, 397–402, 407–14; of inbred mice, 324; and interspecific barriers, 311, 314–15; littering frequency, 218; male density, 192, 193; nest soliciting, 398–9; synchronous, 397–402, 414, 416; synchrony between partners, 397–402; testosterone and, 407–9; variability in mating systems, 191–2, 203–4; see also cross-fostering.

Bicoloured Antbird "Gymnophithys bicolor", pair bonds, 348.

birds: mate choice in, 389–406; re-mating in, 331–60.

Bird of Paradise "Paradisaea decora", mating system, 14–15.

birth rate, maximisation of, 427–8.

Blackcock: male dispersion in leks, 112.

boobies: foraging efficiency, of Red-footed Booby, 43; pair bond persistence of "Sula dactylarura", 344; productivity of "S. dactylarura", 344; see also Gannet.

brain: androgen metabolism, 393; hormone action on, 399–402; neuroendocrine system, 392, 401; testosterone action, 393, 397.

Budgerigar "Melopsittacus undulatus": monogamy, 37; pair bond duration, 43.

butterflies: display and sperm supply, "Pieris protodice", 5, 233; female solicitation, "P. protodice", 25; male choice by size, "P. protodice" 5; size and mating success, 234.

buxom redhead hypothesis, 291, 293.

calls: see vocal signals.

cattle egret, 44.

Chimpanzee "Pan troglodytes": inbreeding avoidance, 263; mate complementarity, 8.

choice of mate: see mate choice.

cicad bugs, 44.

clumping of males in leks, 111–14.

Coke's Hartebeest "Alcelaphus cokii", mother-son monogamy, 40–1.

cockroach "Nauphoeta citreza", male status, 7.

coloniality costs and benefits, 216.

colonies: fidelity to, 362–3, 370; survival rates, 363; see also nest sites; territories; warrens.

compatibility, 8–9, 235, 257; in birds, 339–40, 350, 354, 375; in Kittiwakes during egg incubation, 367.

competition, 211; and choice, 3, 11–14, 20; inclusive fitness effect, 237; intensity of and parental investment, 13, 167.

competition between females, 2, 12, 13, 214; benefits and costs, 168; intensity of, and parental investment, 167; for males, 167, 170–2; for male quality, 168–72, 173–4; for paternal investment, 167, 172; risks, 168, 171; for resources, 167–8, 173–4.

competition between larvae, 145, 245; heritable fitness, 90.

competition between males, 181–92, 215–16; fitness of offspring, 233; on leks, 14–15, 118; male mating success, 233; parental investment, 160–1; passive female choice, 233; plumage, 305; rare male effect, 245; by sexual advertisement, 141–4; size associative mating 202–3; size dependent mating, 202–3; social displays, 305; sperm, 27–8; vocal signals q.v.; see also male-male competition.

Corella "Cacatua temuvirostris", 344.

Cormorant, Flightless "Nannopteron harrisi": divorce rate, 353, 354; pair bond persistence, 342.

cotylidons, male dispersion in leks, 112.

courtship: dating choice, 378; evolution of, 382–3; hormone effects, 390, (androgen) 393; (synchrony between partners) 397–402, (testosterone) 400; intensity of, 10, (fitness indicator) 233, (sperm supply) 5, 233; love levels in, 383; matching hypothesis, 378–9; negotiation of, 382–3; partner familiarity, 339.
Index

courtship (cont.)
partner fidelity, 42–3; and physical attractiveness, 377, 378, 379–80, (level of, between couples) 380; scent release, 220; stimulus-value-role-theory, 379–80; value systems, 380; see also displays by males; vocal signals
courtship behaviour, functions of, 24–5
courtship feeding, 5–6; egg size, 334; fecundity of female, 6; as male quality, 168, 438; pair bond strength, 6
cousins: first-, preference for, 269, 275, (result of inbreeding with) 271–2; third-, preference for, 269
crickets, 112; competitive female choice, Anabrus simplex, 12, 13, 173; male choice for fecundity, A. simplex, 5, 13, 176–7
cross-fostering: behaviour, social and sexual, 312, 315; broadening of species identity, 312; differences between sexes, 315; feeding specialisation, 241; interspecific barriers, 311, 314–15; male plumage preferences, 302; mating preferences, 301–2, 315, 317, 323; olfactory preferences, 323–4; preference for familiarity, 320–3, (siblings) 323–4; sibling recognition, 321–3, 324; species preferences, 312, 314; strain preferences, 323–4; see also experience, early; imprinting
Crustacea; monogamy, 40
cuckoldry, 40; avoidance in anuran amphibians, 204; likelihood of, 177; by satellite males, 192
cues: adaptive cue hypothesis, 127–34; attractiveness g.v.; behavioural, (individual interest) 304–5, (social displays) 303–5; olfactory; species isolation, 315; passive female attraction to, 142; plumage, 303–5; vocal, 195–201; see also under age; experience; phenotypes; size
cues in leks: adaptive cue hypothesis, 127–34; age, 124, 132; arbitrary cue hypothesis, 126–7; dominance of males, 123–4, 132–3; phenotypes of males, 124–6; position effects, 15, 121–3, 145; vigour of display, 124–5, 132

decisions: mate choice tactics, 436–7,

441–3; reproductive strategies, 423, 424, 430–2

Deer, Red: measurement of adaptive cues, 129; reproductive strategies, 426
demes, 319
demography, in sociobiology, 33
Desert Woodlouse Hemilepistus sp., 46; monogamy and brood care, 41; partner fidelity and latent pair bond, 43
diethylstilboestrol, 400
5α-dihydrotestosterone: in blood plasma, 392; effect on mate choice, 394–5; secondary sexual characters, 391 disassortative mating (negative assortment), 240, 242, 311; and offspring fitness, 242
dispersal, 298; of birds from natal area, 8, 241; of males in leks, 109, 111–15, 134, 275; of mice, 319; of migrant birds, 348, 349; and outbreeding, 237, 262–3; probability, 272
displays by males, 10–11, 14–16:
androgens, 399–400; evolution of, 60; leks, (costs) 130, (habitats for) 111, 112, (intrasexual) 14–15, 118, (vigor of) 15, 124, 132; mate assessment, 390; social, 297, 298, 303; spawning of females, 25; species recognition, 299–300; strain recognition, 304–5; vigor of, 10, (and sperm supply) 5, 233
disruptive selection, and fitness heritability, 231

divorce, 332, 364; and age, 365, 366, 368; breeding failure, 353–4, 367, 369–70, 373; in migrant, nomadic and resident bird species, 342–4, 347, 350–1, 353–4; as mate choice, 354; in migratory passerines, 349; and pair status, 366, 367, 368; past duration of pair bond, 366, 369
domestic chicks Gallus gallus, kin recognition, 263
dominance, 7, 11, 14, 62, 261; behavioural and reproductive success in rabbits, 213; in breeding groups of rabbits, 213; in female monkeys, 407, (and male sexual attention) 413–14; in female rabbits, and warren occupation, 212–14, 218; in female sticklebacks, 171; and gonadal hormones in male monkeys, 407–10; hierarchy, 426–7; in human married couples, 381; male hierarchy, 27, (as index of assessment by female) 133; male, in leks, 118, 120, 123–4, 132, 134, 191; in male Mallard social displays, 303; in male monkeys, and sexual behaviour, 407–17; in male rabbits, 213,
dominance (cont.)
215; in nest site selection, 372; in rabbits, and scent marking, 219–20
Dove, Ring Streptopelia turtur: hormone action and courtship behaviour, 25, 393, 397–402; male mate choice, 177
Drosophila melanogaster Fruit Fly: artificial selection on female choice, 90; competition between larvae, 145, 245; courtship of yellow mutants, 5; female preferences and genotype, 64–5; fitness, (components of) 231–3, (heritability of) 228–31; rare male effect, 55, 242–6; sexual difference in fitness variances, 93
duck: American Black Duck, 300; hybridisation, Anas platyrhynchos, 300–1; innate preferences, A. platyrhynchos, 301, 303; Kaspar Hauser females, A. platyrhynchos, 301–2; life pattern, A. platyrhynchos, 297–9; pair bond, Calidris alpina, 343; pair bond maintenance, Anas ferina, Anas fuligula, 348; pair bond persistence, Tadorna tadorna. Tadorna tadorna, 343, 344, 349; plumage of male and choice, A. platyrhynchos, 11, 305, 306; sexual selection, A. platyrhynchos, 305–6; social displays, Anas spp., 299, 303; winter pairing, Aythya spp., 340
eggs: age of parent, (clutch size) 334, (egg size) 334, (hatching success) 336; courtship feeding, (clutch weight) 6, (egg size) 334; double clutching, 172, 173; size of parent, and egg number, 292–3;
Elephant Seal Mirounga angustirostris, intrasexual selection, 11, 13, 20
emancipation, female: male paternal care, 172–3; from ovarian hormone influences, 413
endocrines and monkey sexual behaviour, 407–20
energetics: mating behaviour, 185–7
epigamic characters, 11, 14, 16, 28, 103–4, 105, 120, 169; evolution of, 53–8; intersexual selection, 10; sexual selection, 53, 71
European Rabbit, mate choice in, 211–23
 evolution: adaptive cue hypothesis, 127; of behaviour, 59–60; conflict between sexes, 158–60; diversity of outcomes, 86–7; dynamic modelling strategies, 71–88; female preferences, 56–9; of fitness, 429; freedom from control of oestrus, 413; and genetic variability, 288–9; genetical models, 67–8, 73–88, (male character) 74–88, (preferences)
60–4, 75–8; maladaptive, 89; male characteristics, 53, 58; mate-comparison tactics, 440–1; and monogamy, 46–7; natural selection versus sexual selection, 79–81; Panglossian view, 88; of paternal care, 174; of polyandry, 172–4; primary sexual characters, 69–70; and recombination, 239; reproductive strategies, 423; runaway sexual selection, 57–9, 72–3, 83, 84; secondary sexual characters, 69–70; sexual reproduction, 260; species differences, 184–7; trajectories and equilibria, (stable) 82, (unstable) 83, 84
evolutionarily stable strategies (ESS); degree, of monogamy, 44; discrimination, 151–2, (both sexes) 152–6, 165–7, (one sex) 151–2; mate choice, 150–2; mate location, 187; random mating, 151, (mate quality) 151; sexual advertisement, 142–5; sexual conflict and mating decisions, 156–7; versus dynamic models, 72
experience: display performance, 124; early, (biological function of) 320, (mating preferences) 264–5, (see also under age: cross-fostering; imprinting); kin recognition, 263; and parental care, 438; and productivity, 334–7; and reproductive success, 339, 443
Fairy Prion Pachyptila turtur, pair bond persistence, 344
fecundity, xiv, 5, 6, 9, 13, 101, 129, 132, 292–3; of female, and male mate choice, 177; of females in maximising birth rate, 427–8, (and food supplied) 6; male choice for, 5; related to similarity between spouses, 261; variability in, sources, 176; and weight of adult female, 232
female–female competition, 172–4, 177; in Gallinula chloropus, 170; in Three-spined Stickleback, 171; in wild birds, 305
fertility, xiv, 5, 10, 71, 101, 232, 292–3; female choice for, 5; of male or female Yellow-eyed Penguin, 336; of mate and male mating success, 93, 94, (in Rana catesbeiana) 95, 96, 106; potential, assessment of by possible mate, 390
fidelity: to family, 352; to mate, 36, 37, 42–3, 46, 305, 341, 351, 352, (see also pair bond, duration); to site, 121–2, 281, 286, 349–50, 351, 353, 370–1, 374 finches: assortative mating, Darwin’s Medium-billed Finch, 241; optimal discrepancy hypothesis, Taeniopygia
Index

finches (cont.)
guttata, 267, 270; pair bonds, Fringilla coelebs, Pyrrhula pyrrhula, 37, 348; P. pyrrhula, 44; T. guttata, 44

fishes: assortative mating among ecotypes, Gasterosteus aculeatus, 8; breeding care, Apistogramma spp., Tilapia mariae, 40; choice for size, Cottus bairdi, 5, 6, 13, 19, 177, 201; female choice, competitive in G. aculeatus, 171–2, (male colour) 10, 54–5, (nest) 6; male courtship, Chromis cyanea, 25; monogamy, chaetodonts, Opistognathus aurifrons, Serranus tigrinus, 35, 40, 46; pair bond duration, Apistogramma spp., 43; partner fidelity, T. mariae, 37; polyandry Ceratius spp., 36, 42; rare-male effect, Guppy, 242; solitary reproduction, Rutilus marmoratus, Serranus sublgarius, 35; spawning, C. cyanea, C. bairdi, 13, 22; territorial resources, Pseudohabrus celidotus, 6; timing of reproduction, Platypus, Sunfish, 426

fitness: components of, 95, 231–3, (and mutations) 232; contributions by relatives, 429–30; Darwinian selection, 71; decline and inbreeding, 238; deleterious mutations, 230–1; energy of vocal calls, 198; in evolution, 429; female choice of qualities of, 438; and female mating strategies, 17–18; genetic equilibrium, 91; genetic variance for, 91–2; and good genes, 193–4; heritability of, 9, 90, 92, 194, 228–31, (mutations) 229–30; of individuals, (mate choice tactics) 435, (mate competition tactics) 435; male mating success, 228, 232; maximisation of, 429–30; and monogamy, 37; mutant strategies, 149; mutation dominance, 230; natural selection, 75; non-random mating, 228; and nutrition, 233; Panglossian view, 88; population equilibria, 84; and tactics, 435; tallying of, (by descendents) 89, (by productivity) 89; variance in relative fitness 92, (calculation method) 92n; see also offspring, fitness

fitness variance, analysis of: mathematical guides, 94; and selection, 93–4, 100–2 flukes Diplodoc spp., monogamy, 36

Fly, Hanging Hylabittacus apicalis, courtship feeding, 5

friendship choice: negotiation of, 383, 385; personality, 383–5; personal appearance, 384; social activities, 384–5

Fulmar, Northern, Fulmaris glacialis, 344

Galah Cacatua roseicapilla, 342, 347
Gammarus spp., male investment, 161 Gammarus pulex, non-random mating, 283 Gannet Sula bassana: pair bond persistence, 344; productivity and age, 334–6; see also boobies

geese (cont.)
gene complexes, co-adapted: epistasis and fitness, 235–6
gene pools: contributions to, 216, (by relatives) 429–30; reproductive strategies, 423, 424
genes: good, see good genes; hitch-hiking *q.v.*; for mating preferences, 319
  genetic equilibrium, 81–3, 86; and fitness, 91
  genetic polymorphism, rare male effect, 55
  glucocorticoid synthesis, 391
  good genes, 67; female choice, 145–6; fitness, 193–4; genetic variation, 193–4; handicap theory, 9–10, 144; male quality, 168; mate choice, 105; (for phenotypic expression of) 9–10; sexual selection, 90–1. (Panglossian view) 88
Green Anoles *Anolis carolinensis*, male displays and ovari an development, 25
  gosse, 15–16; copulation interference in
Guinea Pig *Cavia porcellus*, effects of early experience to stimuli, 312, 313
Hamster *Mesocricetus auratus*, interspecific cross-fostering, 314, 315
handicap theory, 9–10, 127, 144–5, 146–7
  Hardy-Weinberg equilibrium, 311
  harem, 12, 34, 45, 172; reproductive strategies, 424, 426; victorious male acceptance, 437
Hawaiian Bird *Neomorphus acutirostris*, natural selection, 69
Hermit Hummingbirds, 124, measurement of adaptive cues, 129
  heterozygotes: and inbreeding, 235; mating preferences, 319; mating success, 229
  hierarchy: in adult female rabbits, 214, 217; in adult male rabbits, 213; dominance, 132–3, 426–7; (in breeding groups of rabbits) 213–14; of male dominance, 27; in social groups of monkeys, 407–10, 413, 415, 417
  hitch-hiking genes: in optimal outbreeding, 260; preference and preferred characters, 60–2; and runaway process, 61
  homozygotes: assortative mating, 311; fitness decline, 238; inbreeding, 235; maintenance, (parthenogenesis) 236, (self-fertilization) 236; mating success, 229
Honey Bee, monogamy, 44
  hormonal mechanism of mate choice in birds, 389–406
hormones: acquisition of preference, 396–7; and behaviour, 390, 391, 393, 395; expression of mate choice, 394–6; female perception of, 389; levels of, affected by social structure, 407–8; maintenance of hierarchies, 415; mate assessment, 390, 391; mate indentification, 391; mechanisms of action, 391–3; ovari an, and sexual interactions, 410–13; receptive behaviour, 413, (in feral monkeys) 414; secondary sexual characters, 390, 391; sexual imprinting, 391, 393–4; and status in hierarchies, 407–10; stress, 217, 409, 410, 414–415, 417, (in dominant and subordinate males) 409; synchrony between partners, 397–402: see also individual hormones; neuroendocrine system
House Martin *Delichon urbica*: pair bond persistence, 343; productivity and age of female, 334
humans: costs of outbreeding, 261–2; early experiences and mating preferences, 264–5; mate choice, 377–85, (and reproductive gain) 428; monogamy, 34, 38–9, 42, 44, 46
hybridisation, 300–1
Ibis, 349
  imprinting: habituation and fine tuning, 270–1; hormones, 391, 393–6; and innate preferences, 301; mate choice, 265; and odour, 317–18; in optimal discrepancy hypothesis, 265; and pair bond, 36; plumage colour, 283, 288, 289; and speciation, 273; species

male–male competition (cont.)

amphibians, 181–210; calling, 195–204; (female response to) 205; combat, 103–5; display, 124–5; in leks, 335–6, 364; and rare-male effect, 245; scramble, 143, 182, 194, 205; strategy, 204; territorial defence, 15, 118–19, 142, 159, 162, 195, 204, 205, 346, 353, 364

Mallard, mate choice in, 297–309

manakins: copulation interference, 119

Golden-headed manakin, White-bearded Manakin, 119; female choice in leks, Chiroxipha linearis, 118; male dispersion in leks, 112; position effect in female choice, White-bearded Manakin, 15

marmots: intersexual conflict, 144; Yellow-bellied Marmot, 218–19; monogamy and brood care, 113; Hoary Marmot, Yellow-bellied Marmot, 40

marriage: personality characteristics, 378, 380–1, (complementarity) 381, (negotiation of roles) 381–2

mate choice, 443–4; active, 141–5; assortative mating and reproductive fitness in Geese, 279–95; benefits, 4–9, 141; in birds, 389–406; buxom redhead hypothesis, 291, 293; for complementarity, 8–9; conflict between sexes q.v.; costs, 9–10, 141; (of discrimination), 148; (major gene effects), 146–9, (gene drift) 146–7, (genetic variance) 148–9, (mistakes) 148, (mutant strategies) 149, (polygenic effects) 149–50; criteria for, 4–11, (immediate benefits) 5–6, (predictors of benefits) 6–11; date of return to colony, 363, 371–2; dating, and self-esteem, 379; discriminate, (both sexes) 152–6, 165–7; (one sex) 151–2; in European rabbit, 211–23; evolutionary consequences, questions to consider, 280; hormonal mechanisms 389–406; in humans, 377–86; and idealisation, 382; and impression of self, (physical attraction) 377, (self-esteem) 377–8; indiscriminate, both sexes, 151; keeping company, 333, 347, 350–1, 354; (in Kittiwake Gull) 361–76; in leks, 109–38; and life style of species, 341, 345–51; and male–male competition in anuran amphibians, 181–210; in Mallard: 297–309; and mate replacement, 345–8; pairing zones, 155, 157; passive attraction, 141–5; and personality, 381; problems in demonstration of, 19–28; random mating, 150; in role-reversed species, 167–79; single allele effect, 264; study of, 3–32; tactics, 435–47

mate choice by females: active, 145–6; costs, 149–50; criteria used, 443–4; decisions, 436–7, 441–3, (fine-tuning) 443, 444, (mate-comparison) 437, (multiple criteria) 441–3, (weighting systems) 442–3, (sequential-comparison) 439, (threshold-criterion) 437–9; demonstration of, by tactics, 444; evolutionary predictions, 84–7; fitness outcomes, 438; handicap theory, 144–5; high fertility, 5; individual interest by male, 304–5; innate model of male, 301–2, 303; intrasexual competition, 211 (dominance hierarchies) 214; leks, between or in, 15, 76–7, 89–90, 109–18, 118–20, 120–6; and major genes, 146–9; of male character, polygenic models, 73–8, 83; and male combat, 102–4; male density, 194; male sampling, 201; mediation of rare male effect, 243–4; multiple mutations, 149–50; (environmental noise) 150; passive, 141–5, (male mating success) 233; preferences, 53–6, (analysis of theory) 63–4, (evolution of) 56–9, 60, 62, (models) 60–4, (genetic differences) 64–5; (genetics of) 60–2, (rare male effect) 55–6, (rate of selection) 63, (relative expression of) 59–60, (response to stimuli) 59; in role-reversed species, 167–74; runaway sexual selection, 73, 83, 84; sexual motivation, 23–7, 411–12; sexual selection by 53–66; size dependent, 6, 13, 19, 22–3, 124, 132, 201, (see also assortative mating, size); species discrimination, (male calls) 192–3, (temperature effects) 196, 201

mate choice by males, 436, 443; attractiveness of female, 379, (non-behavioural) 410–12, 413; for high fecundity, 5, 13; innate factors in, 301; matching hypothesis, 378–9; ovarian hormones of female, 410–13, 414; in role-reversed species, 175–7; and self-esteem, 378–9; and social status, 407–10, 415; species discrimination, 304–5

mate-comparison tactics, 437–41; benefits, 438, 439; costs, 437; evolution of, 440–1

mate location by females: male calls, 4, 10, 183–4, 187, (properties of) 196–201; passive attraction, 141–5

mate location by males, 185, 189; and breeding season lengths, 182–91; models of, 187–90; and male density, 192, 193
mate quality and mating decisions, 141–66
mating decisions, and mate quality, 141–66
mating, non-random, and offspring fitness, 227–55
mating preferences: genes for, 319; innate
abilities, 301–2, 303 optimal discrepancy
hypothesis, 320, 265–71, (fine tuning)
265–6, 269, 270–1, 273; purposes of,
319–20; see also cross-fostering;
experience, early; imprinting; mate
choice by females, preferences
preferences
memory, 18; latent pair bonds, 43–4; mate
comparisons, 437, 443
mice: cross-fostering, Mus musculus,
Onychomys torridus, Peromyscus
leucopus, Peromyscus maniculatus, 312,
314–5, 322–4; effects of early exposure
to stimuli, Acomys calabrinus, 313, 324;
inbreeding and variation, Mus
domesticus, 262; mating preferences,
315–24; optimal discrepancy hypothesis,
fine tuning preferences, Mus. musculus,
273; Peromyscus spp., 324
migration, 319, 348–9
models: assortative mating, 85; dynamic,
(evolution by sexual selection) 71–80,
(polygenic) 73–88, (runaway sexual
selection) 72–3, 83, 84, (versus short-cut
methods) 72; and evolution, 67–8,
73–88, (of behaviour) 59–60, (of paternal
care) 174–5, (of preferences) 60–4, 75–8;
(see also evolutionary stable strategies,
ESS); female mating strategies,
17–18, (choice thresholds) 17, 152–3,
165; female preference, 54; hormone
action and mate choice, 401; hybrid
disadvantage, 157; leks, (adaptive cues)
128–31, (cues in female choice) 125–6,
(despotism) 114, (female preferences)
114–18, (hotspots) 113–14, 117–18,
(position effect) 122–3; limitations of,
71–2; major gene, 146–9; maladaptation,
89; male competition, 56; mate choice,
17–19, 149; optimal discrepancy
hypothesis, 265, 266; optimal
discrepancy mechanism, 271–2;
optimum mating decision, 150–2;
polygenic inheritance, (evolutionary
predictions) 84–7, (genetic covariance
between sexes) 79, 80, (geographic
variation) 86, (male character and
female preference) 77–8, (trait
heritability) 78; preferential mating, 56,
60–4; rare male effect, 55, 244–6;
recombination and evolution, 239;
sexual conflict, gaming models, 158–60,
175; sexual reproduction in variable
environment, 258–9
monkeys: dominance hierarchies, Papio
cynocephalus, 27; female androgens,
Stumptail Macaques, 413; hormone
effects, Macaca mulatta, Miothecus
talapo, 408–15; male status and mating
success, Papio anubis, 27; marmosets,
38; mating and status, M. mulatta, P.
anubis, 27, 407, 408; motivation and
ovulation, baboons, 26; reproductive
strategies, Gelada Baboons, 426; sexual
behaviour, endocrines and, 407–20;
status and mating, M. mulatta, P.
anubis, 27, 407, 408; support to kin, M.
mulatta, 430; timing of reproductive
effort, P. cynocephalus, 427
monogamy, xii, 33–47, 55, 297–8, 331, 345;
bases for occurrence, 45; behaviour
supportive for, 37–9, 45–6; brood care,
39–41; concepts of, 33–6; continuity,
41–4; degree of, 44–5; disruptive uses of
term, 34–6, 41–2; effect of female choice,
55; emotional bond, 38; and evolution,
46–7; fidelity of partner, 42–4, 46; and
gametic contribution ratio, 35–6; in
Mallard, 297, 298; as mating system,
33–5, 37, 39, 45; parental care
commitment, 429; in resident species,
345, 347; as social unit, 34–5, 38–9, 45;
sociobiological versus sociographical
views, 33, 34, 36, 38–9, 41, 45; see also
pair bonds
Moorhen Gallinula chloropus, female mate
choice, 6, 12, 13, 170–2
mortality rates: Kittiwakes, 365, 372; of
migratory passerines, 340–1; and nest
site quality, 339, 364; and re-pairing,
306
moths: local adaptations, 237; Panaxia
dominula, disassortative mating, 242
Nash equilibrium, 143, 159
Natal Robin Cosyphus natatalensis, pair
bond persistence, 342, 348
natural selection: Darwinian, 68–9; fitness,
75: individual behaviour, 427; polygenic
models, male character, 74, 75; primary
sexual characters, 69; reproductive
strategies, 423; secondary sexual
characters, 69; and sexual selection, 57,
68–71, 79–81, 86, 279–80, (analysis of
intensities) 95–7; of site fidelity, 353
negative assortment: see disassortative
mating
nest sites: change of, at re-mating, 370–1;
quality, 193, 337–9, (breeding
nest sites (cont.) performance 364, 374, (female selectivity) 171–2, (mortality) 339, 364, (productivity 337–8, 339; spacing of, and brood survival, 298; see also colonies; territories; warrens 313; and imprinting, 317–18; scent marking, 219–20; sexual preferences, 316, 317–18, 320–1; sibling recognition, 264, 321–3, 324; species isolation, 315; strain preferences, 323–4

optimal discrepancy hypothesis, 265–71, 280, 320; fine tuning of preferences, 265–6, 269, 270–1, 273; imprinting, 265; stimulus cage experiments, 268–70

optimal discrepancy mechanism, 271–2; protection against inbreeding, 271–2; rate of inbreeding, 271–2

optimal outbreeding, 257–77; kin recognition, 262–4; optimal discrepancy hypothesis, 265–71; and rare-male effect, 242; risks and offspring number, 237; spatial separation of sexes, 262–3

outbreeding, 435; balance with inbreeding, 239, 257–62, 263, 273–4, (multiple optima) 262, (optimal) 257, 258; benefits, 237–9; evolutionary potential, 299; maintenance, 438

outbreeding costs, 257, 258–62; breakage of co-adapted gene complexes, 259–60; excessive, avoidance, 150; genetic, 261–2; and inbreeding costs, balance, 239, 257–62, 273–4; infection by pathogens, 259, 262; loss of advantageous genes, 259; and offspring fitness, 247; mate mismatching, 259, 262; optimal, 257–75, (mechanisms) 261; in polypogenous species, 259, 260; risks of environment change, 259, 262, 263

outbreeding depression, 261, 280

Oystercatcher Haematopus ostralegus: assortative mating, feeding specialisation, 241, pair bond persistence, 344, 350

pair bonds: autumnal, 340; duration, 41–4, 46, 281, 298–9, 305, 332, 342–4, 345, 366, 368, (and divorce) 285, 366, 369, (and egg laying date) 335; equivalents of, 36–7; and freedom of action, 36; incompatibility within, and breeding failure, 367, 369–70, 372; keeping company, 333, 347, 350–1, 354; latent, 43–4; in long breeding seasons, 340; of migrant species, 343, 348–9, (passerine) 343, 349; motivations for, 37; of nomadic species, 343–4, 349–51, 353–4; of resident species, 342, 345–8, 352; of seasonal breeders, 352–3; skewed sex ratios, 298; see also fidelity; re-mating parental care, 438; by males, evolution of, 174–5, (and female emancipation) 172–3; mate complementarity, 8;
Index

parental care (cont.): offspring survival, 71; productivity, 428–9; as quality of males, 168; as resource, 167, 173
parental investment, 141, 424, 428–9; costs and benefits, 100–1; definition of, 167; degree of, and mate choice, 13, 167; in fitness, 101–2; by Mallard, 299; and sexual selection, 160–1
Pelican, Brown Pelecanus occidentalis, productivity, 334
personality: and friendship choice, 383–5; in marriage, 378, 380–1; negotiation of roles, 381–2
phenotypes: as cues, 124–6; expression of good genes, 9–10; of male quality, variation in, 169; of mate and chosen mate, 280, 377–8, 443, 444; of offspring and parents, 77–9; rare-male effect, 55; sexual advertisement, 141–4
Pigeon, Feral Columba livia: pair bond persistence, 342; mate male choice, 177
Platypus, timing of reproduction, 426
plumage colour: genetic basis of, 288–9, (and imprinting) 283–5, 288, 289; colour assortative mating, 279, 281–5; elaborate, evolution of, 14–15, 16; female choice, 11, 14, 16, 302, 305, 306; genetical relatedness, 268
polyandry, xi, 27, 35, 36, 42; conditions possibly leading to, 172–3, 177; and sex-role reversal, 174; see also polygamy; polygyny
polygamy, 12, 34, 35, 41, 42, 44, 331n; and female choice, 55; in Long-billed Marsh Wren, 7; Potential, 44; see also polyandry; polygyny
polygenic inheritance models: see under models
polygyny, 34, 35, 55; in lek species, 12; in male Yellow-bellied Marmot, 218–19; in primate, 415; in Red-winged Blackbird, 172; see also polyandry, polygamy
pool-comparison tactic, 439–40; conditions favourable for, 441; detection experimentally, 444; disadvantages, 440; multiple criteria, 442
populations: common ancestry of, 234; deleterious mutations in, 230–1; density of, (and aggression) 214, (and breeding group size) 212, 215, (of males and sex ratio) 185; equilibria, 81–4, 86, (and fitness) 84, 91–2, (and maladaptive structures) 88–9, (and starting position) 83; evolution, (natural versus sexual selection) 81–4, (predictions) 84–7; extinction of, 84; fitness heritability, 228–31; genetic variance, maintenance of, 168–9; histories of, and mating patterns, 227; mutation selection balance, 230–1; optimal discrepancy mechanism, 271–2; rare-male effect, 55 position effects and female choice in leks, 15–16, 121–3, 145
positive assortment: see assortative mating
Prairie Chickens: leks: copulation interference, 119; male dispersion 112
predation, 4, 7, 212, 218; and display activities, 130; of late egg clutches, 335; protection against, (by clumping in leks) 111, 112, (by coloniality) 216, (number of eggs) 6, (warren quality) 218
productivity, factors affecting: age, 333, 334–7; body size, 292–3; mate retention, 367; nest site quality, 364, 337–9; pair bond duration, 332–4, 351–2; status of female parent, 215–17; warren quality 218; see also reproductive output
progesterone: female attractiveness, 410–11, 412; secretion of, stimulus for, 25
prolactin, 409, 414, 415, 417; and infertility, 415
promiscuity, 41–2; definitions of, 35, 36; in Mallard, 298–9
quality, 3, 141, 150–6, 157–8; and body weight, 171; of breeding sites, 6–7, 171–2, 195, 216, 217–18, 337–9, 364; thresholds of, 154–5; see also fitness quality of females, and mate choice, 175–6
quality of males, 171, 299, 305, 311–12; advertisement of, 169–70, (see also vocal signals); female assessment of, 299, 305; and mate choice, 152, 155–6; offspring fitness, 160–1; variance in and female competition, 168–72
Rabbit, European Oryctolagus cuniculus: intrasexual competition, 211, 213–14; reproductive success, 214–17; scent-marking, 219–20; social organisation, 212–13

rare male effect: as artefact, 246; assessment of, 243–4; causes of 55–6, 63; competition between males, (mating ability) 245, (within a strain) 245–6; and outbreeding, 242

rat: interspecific cross-fostering, Balb/c random, 312, 314, 315

ravens: mate-replacement, Corvus corvus, 345–6; pair bonds, C. coronoides, Corvus mellori, 342, 344, 345, 350; partner familiarity, Corvus spp., 339

Red Deer: see Deer, Red

relatives: see kin

re-mating: in birds, 331–60; causes, (divorce) 365, 367, (mortality) 306, 364–5, 367; change of nest site, 370–2; terminology, 332; see also re-pairing; re-uniting

re-pairing, in birds, 332; see also re-mating; re-uniting

reproductive fitness, assortative mating and mate choice in Snow Geese, 279–95

reproductive output, 425–30; aided by relatives, 429–30; birthrate maximisation, 427–8; energetic resources, 426; fitness, 429–30; parental investment, 428–9; timing of effort 426–7; see also productivity

reproductive strategies: birth rate maximisation, 427–8; components of, 424–5; decisions, 423, 424, (network of) 430–2; (mating success) 424, 424, (maximisation of) 425–6; rearing, 423, 424, (maximisation of) 428–9; survival, 423, 424; timing of effort, 424, 426–7, 432, (energetic resources) 426, (population demography) 426–7

resources, 6–7; in colonies, 216; energetic, in reproductive output, 216, 424, 426; of males and female choice, 234; as parental investment, 167, 168, 169; scarcity of, and competition, 167–8, 173–4; territorial, 172, 184, 194, 195; see also nest site; quality; warrens, qualities of

re-uniting, 342–4, 353; advantages, 332–40; and breeding success, 351–2, 369, 373; and life style of species, 341, 345–51; and longevity, 340–1; see also re-mating; re-pairing

Robins, pair bond persistence, Cassiophora natalensis, Erithacus rubecula, 342, 348

rods, early experience and sexual preference in, 311–27

role-reversed species: female mate choice, 167–74; male mate choice, 175–7

Ruff: copulation interference in leks, 119; mating system, Philomachus pugnax, 15; position in leks, effect on female choice, 122; strategies in leks, 110, 117

runaway sexual selection, 57–9, 60, 72–3, 83, 84, 126–7; call loudness, 199, 200; checks to, 58; mating success and offspring fitness, 228; origin and cessation, 87–8

sandpiper: copulation interference in leks, Buff-breasted Sandpiper, 119; double clutching, Actitis macularia, 172; pair bond persistence, Calidris alpina, Calidris mauri, Micropalama himantopus, 343

satellite males, 188–93, 195, 212, 213, 215, 216; in leks, 15, 114, 117

scent marking, 219–20; see also olfactory experiences

selection, analysis of: and analysis of fitness variance, 100–2; correlated responses, 99; and evolution, 98–100; on males and females, intensities of, 93–4; natural and sexual, intensities of, 95–7

selection, multivariate, 97–8

selection differentials, 95, 97, 98

self-esteem: matching hypothesis, 378–9; mate choice, 377–8

sequential-comparison tactic, 439–40

advantages and disadvantages, 440; conditions favourable for, 441; detection experimentally, 444

sex-limited characters, 73n

sex ratio, 93, 153, 156, 168, 266, 286; asymmetry, 158; female-biased, 237; in leks, 112; male-biased, 185; operational, 44, 160, (in anuran amphibians) 185, (at breeding site) 205; (in Kittiwake breeding colonies), 371–2; skewed, 172, 237, 298; in Variegated Tinsamou, 174

sexual behaviour, 4, 18; display in birds, 124, 303, 397–9; effects of rearing disturbances in early life of rodents, 312–16; in monkeys, endocrines and, 407–20; in North American Red-spotted Newt, 23–4

sexual conflict: see conflict between sexes

sexual preference and, early experience in rodents, 311–27

sexual selection: assortative mating, 73, 79, 85; Darwinian, 3, 10, 11, 13, 53–5, 58; 68–71, 102, 279; dynamic models of
Index

sexual selection (cont.)
evolution by, 56–9, 60–4, 71–88; extinction of population, 84; by female choice, 53–66; female mate choice, 102–4; and fitness, 71; inter- and intra-, 3, 10, 11–14, 53; in leks, 76–7, 89–90, 109–10; maladaptation, 88–9; male characteristics, 53, 55, 71; male combat, 102–4; male investment, 160; male mating success, 71; and natural selection, 57, 68–71, 79–83, 86, 279–80; Panglossian view, 88–9; and parental investment, 160–1; partitioning, 102; polygenic models of male character, 74–88; runaway process, 57–9, 60, 126–7; (dynamic models) 72–3, 83, 84; theories of, and mating process, 435

sexy son hypothesis, 10, 89
shag Phalacrocorax aristotelis, nest site quality and breeding success, 339
sharwater: divorce rate, Puffinus puffinus, 353; pair bond persistence, Puffinus griseus, P. puffinus, 344
Sheep, Mountain, timing of reproduction, 426
Shrike, Yellow-billed Corvinella corvina, 446–7
shrimps Hymenocera spp., monogamy, 37
sibling: colour and mate choice, 284–5; early experiences and mating preferences, 301, 323–4; recognition by olfaction, 324; see also kin
size: assortative mating for, 194, 201–3, 292; cue for choice, 5, 6, 13, 19, 124, 132, 201; dependent mating, 201–2, 203; and egg number, 292–3, 428; heritability of, 292; of males and mating success, 234, 245; mate location, 187–8, 191; and parental care, 438; and vocal calls, 189–90, 191, 196; see also weight
skua: colour morphs and selection, Stercorarius parasiticus, 280, 286; pair bond persistence, Stercorarius skua, 344; productivity, S. parasiticus, 333–4; selection, S. parasiticus, 280, 286
Skylark Alauda arvensis, pair bond persistence, 342, 348
Snow Geese, assortative mating, mate choice and reproductive fitness, 279–95
Song-thrush Turdus philomelos, pair bond persistence, 342
sparrow: assortative mating, White-crowned Sparrow, 241; monogamy and brood care, Passerculus sandwichensis, 41; pair bond persistence Melopiza melodia, Spizella pusilla, 343; Tree Sparrow, 44
speciation; and assortative mating, 240; sexual imprinting, 273; sexual selection, 87
species reproductive barriers: and behaviour, 311, 314–15; and cross-fostering, 311, 314–15; differential dispersal of young, 8; maintenance of, 315; olfactory cues 315; vocal signals, 22, 181, 196
sponges Euplectella spp., 36
status, female: and access to males, 407; and aggression, 413–4; dominance hierarchies, 214, (aggression) 216; and metabolic rate, 216–17; and oestrogen treatment, 414, 416; reproductive success, 214–17; sexual attention received, 413
status, male: and access to females, 213–14; dominance hierarchies, 213, (aggression) 215–16; female choice, 7, 11, (leks) 123–4, 132–3; hormone levels, 407–10; maintenance of hierarchies, 413; lek size and mating frequency, 115; mating success, 7, 27; social displays, 303; scent marking, 219–20
Stellar’s Jay Cyanocitta stelleri, pair bonds, 348
stimulus-value-role theory, 379–80
Sunfish, timing of reproduction, 426
survival, 331; and advertisement, 143–4; migratory passerines, 340–1; and nest spacing, 298; of offspring, 71, 218, 428–9; and parental care, 71; of partner and re-uniting, 340–1; reproductive strategies, 423, 424; status of female parent, 215
swallow: brood care, Riparia riparia, 40; monogamy, R. riparia, 40; pair bond persistence, Hirundo neoxena, 343, 349; Woodswallows, 349
swan: pair bonds, 333, 349, (Cygnus olor) 342; partner fidelity, 37
swift Apus apus, pair bond persistence, 343
tactics, life history and alternative strategies of reproduction, 423–33; of mate choice, 435–47
target cells: androgen metabolism, 393; aromatase activity, 391, 400; diethylstilboestrol, 400; oestradiol formation, 400–1; oestrogen formation, 391, 392; oestrogen receptors, 400
Temminck’s Stint Calidris temminckii, double clutching, 172
tern, common Sterna hirundo, courtship feeding, 6
territories: and breeding groups, 212; defence, (by female rabbit) 212, 218, (by male) 15, 205, 336, 346, 353, 364; lek, 15–16, (male dominance) 118, 123–4; mating systems, 182, 184, 188–9; of migrant species, 348; of nomadic species, 349–50; quality of, 6–7, 172, 195, (mortality rates) 339, (productivity) 335, 337–8, 339; of resident species, 345–8, 352; resources, 172, 184, 194, 195; scent marking of, 219–20; see also colonies; nest sites; warrens
testosterone: aggression between males, 408–9; brain mechanisms, 397; courtship behaviour, 400; hypothalamic areas, 393; levels of, affected by social structure, 407–8; mate preferences, 395, 397; precursor of androgens, 391; receptiveness in females, 413; scent gland activity, 219, 220; and sexual activity, 407–9, (of dominant males) 407, 409, (of subordinate males) 408–9; spermatogenesis, 409–10
threshold-criterion tactic, 437–9: costs and benefits, 437, 438; detection experimentally, 444; multiple criteria, 439, 442
timing, of reproductive effort, 424, 426–7, 432
Timamou, Variegated Crypturellus variegatus, competitive female choice, 174
tit: fitness heritability, Parus major, 231; optimal discrepancy hypothesis, P. major, 270; pair bond persistence, P. major, Parus palustris, 342; productivity, P. major, 334; territory quality, P. major, 388–9
toad: androgen effects, Xenopus laevis, 390; calls, Bufo calamita, 197, 199, 200–1; male density and sex ratio, Bufo americanus, Bufo typhonius, 185; mate location, Bufo bufo, B. calamita, Bufo cognatus, Bufo houstonensis, Bufo speciosus, Bufo valliceps, Bufo woodhousei, 182–3, 186, 188–90; mating system, B. calamita, Bufo canorus, 192; non-random mating, B. americanus, B. bufo, B. calamita, Bufo quercinus, Bufo terrestris, B. typhonius, 202; sex ratio and male density, B. americanus, B. typhonius, 185; size assortative mating, B. bufo, 194, 202–3; weight loss, B. bufo, B. calamita, 186, 191

Uganda Kob, position effect in lek, 15, 121–2
vocal signals, anurans: advertisement calls, 14, 183, 189, 196, 200–1; auditory limitations, 199–201, 205; body size, 189–90, 191, 196; call groups, 190, 191; choruses, 184, 197, 198–9; encounter calls, 183; energy content, 198–9; female mate choice, 195–201; and male density, 192, 193; mate location, 188–91, 192; pitch and female discrimination, 196–8, (temperature effects) 196; sites of calling, 197–8; species identification, 192–3; species isolating mechanisms, 22, 181, 196; synthetic, 181, 183, 189, 190, 197, 198–9; temperature effects, 196, 201, 205
voile: interspecific cross-fostering, Microtus caniculus, Microtus montanus, 314

Wagtail, White Motacilla alba, pair bond maintenance, 348
warbler: brood care, Acrocephalus palustris, 40; pair bond maintenance, Acrocephalus orientalis, Phylloscopus trochiloides, 348; pair bond persistence, Dendroica discolor, 343
warrens, 212; evolution of, 217; qualities of, 216, 217–18
wasps, 20; rare-male effect, 243–4, (parasitic wasp) 242
weight of female, and mate choice, 12, 177, (and mate quality) 171; loss of, and energetics, 186, 191; of parent, (and fledglings) 337, (and hatching success) 336
wren: age of female and productivity, Malurus splendens, 334; mate replacements, Malurus spp., 346–7; pair bond, Malurus spp., M. splendens, 342, 346–7; pair bond persistence, Troglydtes aedon, 343; productivity and age of female, M. splendens, 334
Zebra, steppe Equus quagga, polygamy, 34, 42
