Preface	ix	
1 Introduction		page 1
1. The nature of statistical prediction analysis	1	
2. Some examples	1	
3. Examples of choice of future experiment	4	
4. Examples of detection of future experiment	6	
2 Predictive distributions		17
1. Notation and terminology	17	
2. Two sources of information and their combination	18	
3. The predictive density function	19	
4. Predictive distributions for the standard situations	26	
5. Prediction for regression models	32	
6. An application to medical prognosis	35	
3 Decisive prediction		45
1. Point prediction	45	
2. An application to machine tool replacement	50	
3. Set prediction	54	
4. Further analysis of the machine tool problem	57	
5. Computational aids for more general utility functions	60	
6. An alternative formulation	64	
4 Informative prediction		68
1. Introduction	68	
2. Bayesian informative prediction	69	
3. Region of previous experience	72	
4. An application to metabolite excretion rates	73	
5. Bayesian coverage	77	
6. Statistical tolerance regions: role of coverage distributions	79	
5 Mean coverage tolerance prediction		88
1. Introduction	88	
2. Interpretation of similar mean coverage tolerance predictors	91	
3. Additional criteria	92	
4. Relationship to Bayesian coverage	93	

<i>vi</i>	<i>Contents</i>	
	5. Mean coverage tolerance predictors for the binomial case	94
	6. Mean coverage tolerance predictors for the Poisson case	97
	7. Mean coverage tolerance predictors for the gamma case	99
	8. Mean coverage tolerance predictors for the normal case	101
	9. Mean coverage tolerance predictors for the multinormal case	104
	10. Mean coverage tolerance predictors for the two-parameter exponential case	105
6	Guaranteed coverage tolerance prediction	110
	1. Introduction	110
	2. Interpretation of similar guaranteed coverage tolerance predictors	113
	3. Guaranteed coverage tolerance predictors for the binomial and Poisson cases	114
	4. Guaranteed coverage tolerance predictors for the gamma case	117
	5. Guaranteed coverage tolerance predictors for the normal case	118
	6. Guaranteed coverage tolerance predictors for the multinormal case	123
	7. Guaranteed coverage tolerance predictors for the two-parameter exponential case	124
7	Other approaches to prediction	131
	1. Introduction	131
	2. Linear utility structure	131
	3. Frequentist decision theory	132
	4. Frequentist linear utility theory	133
	5. Prior probabilities on the sample space	135
	6. Empirical Bayes prediction	137
	7. Distribution-free prediction	138
8	Sampling inspection	146
	1. Introduction	146
	2. Fixed-size single-sample destructive testing	146
	3. Role of mean coverage and guaranteed coverage tolerance predictors in sampling plans	152
	4. Optimum choice of fixed sample size	154
	5. Sequential predictive sampling inspection	156
9	Regulation and optimisation	162
	1. Introduction	162
	2. Point regulation	163
	3. Set regulation	170
	4. Regulation problems with a finite index set	172
	5. Optimisation	173
10	Calibration	181
	1. The nature of a calibration problem	181
	2. The calibrative distribution	185

<i>Contents</i>	<i>vii</i>
3. Calibrative distributions for the normal case	189
4. Two applications of calibrative distributions	192
5. The search for tractable prior distributions	197
6. Calibration under a utility structure	198
7. Some comparisons of methods	199
8. An application to antibiotic assay	205
11 Diagnosis	212
1. The nature of a diagnostic problem	212
2. The diagnostic distribution	215
3. An illustrative example	221
4. Monitoring for atypicality	224
5. Estimative and predictive diagnosis	227
6. An application to differential diagnosis of Conn's syndrome	231
7. Diagnosis under a utility structure	234
12 Treatment allocation	238
1. The nature of a treatment allocation problem	238
2. The prognostic distributions and utility structure	240
3. Two applications	241
4. Treatment allocation to meet a required specification	246
Appendix I	249
Appendix II	258
Bibliography	259
Author index	267
Subject index	269
Example and problem index	273
