<i>List of principal symbols and abbreviations used</i>	ix
<i>Preface</i>	xii
1 Introduction	1
2 Historical	6
3 Calorific equivalents	24
3.1 Bomb calorimetry	24
3.1.1. Adiabatic bomb calorimetry	24
3.1.2. Ballistic bomb calorimetry	28
3.2 The oxidation of foodstuffs and excreta	30
3.2.1. Carbohydrate	30
3.2.2. Fat	31
3.2.3. Protein	32
3.2.4. Incomplete oxidation	32
3.2.5. A shorter approach	34
3.3 Review of published values	38
3.3.1. Calorific factors	38
3.3.2. Tables and equations for respiratory exchange measurements	43
3.3.3. Calculation from carbon-nitrogen balance	47
3.3.4. Metabolic water	48
3.4 Summary and recommendations	49
4 Indirect calorimeters	50
4.1 Confinement systems	52
4.1.1. The Rowett Research Institute confinement respiration chambers	52
a. Chambers and ventilation	52
b. Pressure control	53
c. Gas sampling, analysis and calculation	53
4.1.2. Pressure control by volume adjustment	54
4.1.3. Design theory	54

iv *Contents*

4.2	Closed-circuit	57
4.2.1.	Small animal respirometers	57
	a. Constant pressure systems	57
	b. Constant volume systems	59
4.2.2.	Large animal respiration chambers	62
4.2.3.	Human respiration chambers	68
	a. The Atwater and Benedict respiration chamber	68
4.2.4.	Spirometers	71
	a. Types of spirometer	72
	b. The use of a spirometer	73
	c. Spirometers as oxygen reservoirs	74
	d. Spirometers for large animals	74
	e. Calibration and errors	75
4.3	Total collection systems	76
4.3.1.	Rigid collecting chambers	76
4.3.2.	Bag systems	78
	a. The Douglas bag	78
	b. Other types of bag	82
4.4	Open-circuit systems	83
4.4.1.	Portable systems (sample collection)	83
	a. The Kofranyi–Michaelis (K–M) or Max Planck respirometer	83
	b. The integrating motor pneumotachograph (IMP)	86
	c. The Miser	88
	d. The Oxylog	89
	e. Tracheal cannulation techniques	90
4.4.2.	Ventilated flow-through systems	93
	a. Open-circuit chambers	94
	b. Ventilated hoods	95
	c. Masks and mouthpieces	96
	d. Ventilation and air-conditioning	96
	e. Gas mixing	97
	f. Measurement of flowrate	98
	g. Methods of gas analysis	98
	h. A portable flow-through system – the metabolic rate monitor	99
4.5	Calculation methods	100
4.5.1.	Steady-state conditions	102
	a. Oxygen consumption from oxygen analysis and carbon dioxide absorption	102
	b. Oxygen consumption when all respiratory gases are analysed	104
	c. Carbon dioxide and methane production	105
	d. Respiratory quotient	106
	e. Metabolic rate	106

<i>Contents</i>	<i>v</i>
4.5.2. Dynamic conditions	108
4.5.3. Practical aspects	111
4.6 Other indirect systems	112
4.6.1. Labelled carbon	113
4.6.2. Doubly labelled water	114
4.6.3. Measurements that correlate with heat production	117
4.7 Summary	118
5 Direct calorimeters	120
5.1.1. The psychrometric chart	120
5.2 Types of direct calorimeters	122
5.2.1. Isothermal calorimeters	122
5.2.2. Heat-sink calorimeters	126
5.2.3. Convection calorimeters	127
5.2.4. Differential calorimeters	127
5.3 Gradient-layer calorimeters	128
5.3.1. The Hannah Research Institute large animal calorimeter	128
a. The animal chamber	129
b. Ventilation	133
c. Air sampling	134
d. Water cooling system	136
e. Instrumentation	137
f. Initial calibration	138
g. Routine calibration and operation	139
h. Performance	140
5.3.2. Gradient layers	141
a. Basic sensitivity	142
b. Spacing of measuring points	142
c. Speed of response	143
d. Resistance-thermometer layers	144
e. Thermocouple layers	146
f. Construction	152
5.3.3. Animal chambers	153
a. Air leaks	153
b. Heat leaks	154
c. Illumination	154
d. Animal-restraining structures	155
5.3.4. Ventilation	155
a. Ventilation rate	155
b. Platimeters	156
c. Thermopiles	161
d. Fans, heaters, ducting, etc.	161
5.3.5. Temperature control	163

vi *Contents*

5.4	Heat-sink calorimeters	165
5.4.1.	The Dunn calorimeter	165
a.	The structure and ventilation	165
b.	Water circulation	166
c.	Estimation of heat losses	167
d.	Calibration	168
5.4.2.	Other heat-sink calorimeters	168
5.4.3.	Suit calorimeters	169
5.5	Convection calorimeters	172
5.6	Differential calorimeters	175
5.7	Evaporative heat loss	176
5.8	Other energy exchanges	180
5.9	Body heat storage	181
5.9.1.	Mean skin temperature	181
5.9.2.	Mean body temperature	183
6	Instrumentation	184
6.1	Instruments for basic measurements	185
6.1.1.	Voltage	185
6.1.2.	Temperature	185
6.1.3.	Humidity	187
a.	Wet- and dry-bulb psychrometers	187
b.	Dewcells	188
c.	Peltier cooled mirrors	188
6.1.4.	Pressure	190
6.2	Equipment for gas analysis	190
6.2.1.	Chemical analysis	191
a.	Haldane analysis	191
b.	Scholander gas analyser	194
6.2.2.	Physical analysers	196
a.	Oxygen electrodes or polarographic cells	197
b.	Paramagnetic oxygen analysers	200
c.	Infra-red gas analysers	209
d.	Mass spectrometers	214
e.	Thermal conductivity	215
f.	Fuel cells	216
g.	Gas chromatography	217
6.3	Instruments for the measurement of volume and flow	218
6.3.1.	Measurement of volume	219
a.	Wet gasmeters	219
b.	Dry gasmeters	222
c.	Wright respirometer	225
6.3.2.	Volume flowrate	226
a.	Turbine flowmeters	226
b.	Pneumotachograph	226
c.	Orifice flowmeters	227

<i>Contents</i>	vii
6.3.3. Mass flowrate	227
a. Critical flowmeters	227
b. Thermal flowmeters	228
6.3.4. Variable-area flowmeters	230
6.4 Recorders and data loggers	232
6.5 Other instrumentation	234
6.5.1. Food supply	234
6.5.2. Collection of excreta	235
6.5.3. Safety aspects	237
7 Calibrations and standards	238
7.1 Standardisation of basic measurements	238
7.2 Calibration of gas analysers	238
7.2.1. Introduction	238
7.2.2. Sample conditioning	239
7.2.3. Calibration requirements	242
7.2.4. Standard gases	245
a. Zero gas	245
b. Dry fresh air	245
7.2.5. Calibration-gas mixtures	245
a. Static methods	246
b. Dynamic methods	246
c. Checking the composition of calibration mixtures	249
7.2.6. Linearity checks of oxygen analysers	251
a. By means of gas mixtures	251
b. By variation of pressure in the analytical cell	252
7.2.7. Calibration of pressure-sensitive oxygen analysers by the variable-pressure method	253
7.2.8. Calibration of carbon dioxide and methane analysers	259
a. Linearity checks	259
b. Routine calibration	261
7.3 Calibration of flowmeters	261
7.3.1. Soap-bubble flowmeters	262
7.3.2. Wet gasmeters	265
7.3.3. Critical-orifice flowmeters	268
7.3.4. Spirometers and gasometers	271
7.3.5. Gravimetric calibration	272
7.3.6. Dilution method	273
7.3.7. Calibration of flowmeters that measure pulsatile flow	273
7.4 Whole system checks	274
7.4.1. Recovery of heat	274
7.4.2. Recovery of carbon dioxide	275
7.4.3. Recovery of oxygen	276
a. Nitrogen injection	276
b. Steel-wool burners	278

viii	<i>Contents</i>	
	7.4.4. Combined methods	280
	a. Alcohol burners	280
	b. Agreement between direct and indirect calorimetry	281
	7.4.5. Calibration: the golden rules	282
	7.5 Some additional problems encountered	282
	8 Some complete open-circuit systems	284
	8.1 Using a simple voltage recorder	284
	8.2 Switched-range recorder and twin-channel oxygen analyser	287
	8.3 Systems using divided reservoirs	287
	8.4 The Leeds indirect flow-through calorimeters	289
	8.4.1. The semi-automated human calorimeter	290
	8.4.2. The semi-automated, multichamber small animal calorimeter	292
	8.4.3. The computer-controlled multichamber small animal calorimeter	296
	Appendices	
	A1 Calculation of calorific factors from elemental composition	299
	A2 Solution of equations for heat production, and carbohydrate and fat metabolised	300
	A3 Report of the Brouwer Committee (1965)	302
	A4 Analysis of heat flow through gradient layers	305
	1. The basic insulating layer	305
	2. The metal foil covering the insulating layer	306
	3. Reduced temperature gradient due to lateral heat flow in the thermocouple tape	306
	4. Direct heat flow through the metal bridges	308
	5. Heat flow at the edges of platimeters	308
	A5 Some physical properties of materials used in constructing calorimeters	311
	References	312
	Index	335
