<i>Preface</i>	vii
Part 1	
<b>1 Gaussian elimination</b>	1
Description and application of an algorithm to reduce a matrix to row echelon form	
<b>2 Solutions to simultaneous equations 1</b>	11
Use of the GE algorithm. The different possible outcomes. Inconsistent equations. Solutions involving arbitrary parameters.	
<b>3 Matrices and algebraic vectors</b>	23
Sums and products of matrices. Algebraic laws. Simultaneous linear equations considered as a single matrix equation.	
<b>4 Special matrices</b>	33
Zero matrix, diagonal matrices, identity matrices. Transpose of a matrix, symmetric and skew-symmetric matrices. Elementary matrices and their relation with elementary row operations.	
<b>5 Matrix inverses</b>	45
Invertible and singular matrices. Algorithm for finding inverses. Inverses of products.	
<b>6 Linear independence and rank</b>	55
Algorithms for testing linear dependence or independence. Rank of a matrix. Equivalence of invertibility with conditions involving rank, linear independence and solutions to equations (via the GE algorithm).	
<b>7 Determinants</b>	65
$2 \times 2$ and $3 \times 3$ determinants. Methods for evaluation. Effects of elementary row operations. A matrix is invertible if and only if its determinant is non-zero. Determinant of a product. Adjoint matrix. Indication of extension to larger determinants.	
<b>8 Solutions to simultaneous equations 2</b>	81
Rules involving the ranks of matrices of coefficients and whether the matrix is invertible.	
<b>9 Vectors in geometry</b>	87
Representing vectors by directed line segments. Algebraic operations interpreted geometrically. The Section Formula. The standard basis vectors $i, j, k$ . The length of a vector.	
<b>10 Straight lines and planes</b>	105
Straight lines using vector equations. Direction ratios. Scalar product of two vectors. Angles between lines. Planes. Intersections of planes.	
<b>11 Cross product</b>	123
Definition and properties of the vector product. Areas and volumes. Scalar triple product. Coplanar vectors. Link with linear dependence via determinants.

Table of Contents

[More information](#)

vi	<i>Contents</i>	
	Part 2	
12	<b>Basic ideas</b>	137
	Recapitulation of ideas from Part 1 which are required for Part 2. The column space of a matrix.	
13	<b>Subspaces of <math>\mathbb{R}^n</math></b>	147
	The space spanned by a finite list of vectors. Methods for determining whether a given set of vectors is a subspace of $\mathbb{R}^n$ .	
14	<b>Spanning lists, bases, dimension</b>	163
	Linearly independent spanning lists. Basis. Dimension.	
15	<b>Rank</b>	181
	Spaces of row vectors. Column space and row space of a matrix.	
16	<b>Linear transformations</b>	189
	Functions represented by matrices. Geometrical illustrations. Kernels and images of linear transformations.	
17	<b>Change of basis</b>	205
	Methods for calculating components with respect to one basis when components with respect to another basis are given. Geometrical illustrations.	
18	<b>Eigenvalues and eigenvectors</b>	215
	Characteristic equation of a matrix. Method for calculating eigenvalues and eigenvectors. Symmetric matrices. Some simple properties.	
19	<b>Diagonalisation 1</b>	229
	Linearly independent lists of eigenvectors. Diagonalisation of real symmetric matrices.	
20	<b>The dot product</b>	239
	Extension of geometrical ideas of length and angle. Orthogonality of vectors.	
21	<b>Orthogonality</b>	251
	Orthogonal basis. Orthonormal basis. Methods for finding orthonormal bases. Orthogonal matrices.	
22	<b>Diagonalisation 2</b>	263
	Diagonalisation via an orthogonal matrix. Treatment of real symmetric matrices with repeated eigenvalues. Diagonalisation of linear transformations.	
23	<b>Geometry</b>	277
	Quadratic forms. Equations of conics and quadric surfaces. Use of the diagonalisation process to convert such equations to a standard form.	
24	<b>Differential equations</b>	289
	Finding the general solution to a system of simultaneous linear first-order differential equations, using the diagonalisation process.	
	<i>Answers to exercises</i>	300
	<i>Sample test papers for Part 1</i>	313
	<i>Sample test papers for Part 2</i>	319
	<i>Further reading</i>	325
	<i>Index</i>	327
