Frontispiece	xiii
Preface: what is this book all about?	xv
Notational conventions used in this book	xx
List of abbreviations	xxiii
Part I. Genes and their expression	1
1 What is a gene?	3
The arrangement of DNA in the cell	4
The structure of single-gene coding regions of DNA	4
Changes in DNA: mutations	8
Appendix 1.1: Essential aspects of DNA structure and function	10
Appendix 1.2: Molecular methodology related to identifying genes	16
2 The logic of the genome	19
The organization of the genome	19
The organization of the body and its physiology	26
Conclusion	30
Appendix 2.1: A brief summary of the lipid system	30
3 Concepts of frequency and association in populations	37
Basic concepts of trait frequency and risk	37
Model-free measures of association	42
Conclusion	50
Notes	51
4 Genes and phenotypes in populations	52
Frequency concepts for genetic traits	52
Frequency relationships between genotype and phenotype	56
The causal spectrum and the concept of a genetic model	59
Conclusion	62

x	<i>Contents</i>	
	Appendix 4.1: The likelihood method and some principles of genetic inference	62
	Part II. Introduction to genetic epidemiology: inference from observational data	67
5	Segregation analysis: discrete traits in families	69
	Nuclear families and sibships	69
	Segregation analysis in pedigrees using likelihood methods	75
	Epidemiological approaches: risk in relatives of affected individuals	85
	Caution: discrete traits need not have single-locus control!	88
	Conclusion	89
	Notes	89
	Appendix 5.1: Some miscellany	90
6	Segregation analysis: quantitative traits in families	92
	Einstein's trains: assigning phenotypic effects to genotypes	92
	Mendelian transmission and the quantitative resemblance between relatives	96
	Extension to multiple loci: polygenic traits	101
	Demonstrating a role for genes in a quantitative trait	104
	Understanding more of the causal spectrum	107
	A comment	115
	Notes	115
7	Linkage analysis: finding and mapping genes for qualitative traits	117
	Association between loci	117
	Linkage mapping in families with marker loci	118
	Linkage mapping using multiple markers and other strategies	123
	Some special linkage mapping strategies	127
	The step from genetic linkage to physical mapping	131
	Conclusion: methods triumphant	133
	Notes	134
	Appendix 7.1: Some statistical and sampling issues in linkage studies	134
8	Linkage analysis: finding and mapping genes for quantitative traits	137

<i>Contents</i>	xi
Association studies for quantitative traits	137
Linkage analysis for quantitative traits	140
Conclusion	148
Appendix 8.1: A note on statistical power for linkage studies	149
Part III. Evolution: the time dimension in populations	151
9 Genes over time and space	153
Life is fundamentally stochastic: the fate of a new mutation	153
More on the distribution of genetic variation at a locus	158
The sojourn of a mutation affected by selection	164
Multilocus phenotypes: buffered systems evolving by phenotypic selection	167
Conclusion	178
10 Reconstructing history: the footprints of evolution	180
What is responsible for the observed frequency of disease?	180
Clonal and cladistic analysis of qualitative diseases	186
Cladistic analysis for quantitative traits	194
Genetic admixture: natural experiments with disparate genes	196
Conclusion: phenotypic convergence due to genotypic divergence	203
11 Evolution generates heterogeneity	205
The ‘Rusty Rule’	205
Etiological and phenotypic heterogeneity for qualitative traits	205
Etiological heterogeneity for quantitative traits	218
Approaches to heterogeneity in family data	220
Conclusion	224
Part IV. Modification of the inherited genotype: the time dimension in individuals	227
12 Phenotype amplification by the environment	229
Diverse forms of allometry	229
The complex map from genotype to phenotype	229
Risk factors for quantitative phenotypes	231
Risk factors for qualitative phenotypes	239
Pleiotropy, multivariate phenotypes, and genetic syndromes	243

xii	<i>Contents</i>	
	Other allometric considerations	250
	Conclusion	252
13	Infectious disease: the response to biological challenge	253
	Offensive and defensive strategies against evolving threats	253
	Somatic recombination and intra-individual variability	253
	Human leukocyte antigens: individual uniqueness and the friend or foe problem	261
	Defensive strategies by non-immunological mechanisms	270
	Conclusion	271
14	Variation within the inherited genotype	273
	Mechanisms for non-mendelian inheritance	273
	Phenotypic variation within the same genotype	276
	Imprinting: inherited genetic variation that is not sequence based	278
	Conclusion	285
15	Cancer and aging: a microcosm of evolution during life	286
	Somatic mutation: the genotype changes with age	286
	The calibration of the human lifespan and the age-pattern of disease	297
	Conclusion	302
	Afterwords: towards a unified general model	304
	Conclusion	313
	Notes	314
	References	315
