Introduction

British and American as national varieties

There are many varieties of English other than British (here the English of the United Kingdom) and American (here the English of the United States). All of those other varieties are intrinsically just as worthy of study and use as British and American. But these two varieties are the ones spoken by most native speakers of English and studied by most foreign learners. They have a special status as the two principal national varieties of the language simply because there is more material available in them than in any other variety.

British is the form of English now used in the country whence all other forms of English have ultimately derived. But present-day British is not the origin of any other variety of the language; rather it and all the other varieties are equally descendant from a form of English spoken in the British Isles in earlier times. In some respects, present-day British is closer to the common ancestral form of the present-day varieties than is American or other varieties; but in other respects the reverse is true, and American, for instance, preserves older uses that became obsolete in British use. To mistake present-day British for the ancestor of all other forms of English is a logical and factual error.

The focus of this study is on how contemporary British English differs from American. That is, in comparing two varieties of a language, it is convenient to take one as the basis for comparison and to describe the other by contrast with it. This study takes American as its basis and describes British in relation to that basis. The reason for this approach is that American has more native speakers than British and is rapidly becoming the dominant form of English in non-native countries other perhaps than those of Western Europe. Much European established academic bias favors British as a model; but evolving popular culture is biased toward American. This widespread dissemination of the American variety makes it a reasonable basis for describing British.
2 Introduction

Differences between British and American

The most obvious difference between British and American is in the “tune” of the language, that is, the intonation that accompanies sentences. When a Briton or an American talks, they identify themselves primarily by the tunes of their respective varieties. In singing, the prose tune is overridden by the musical tune, making it much harder to distinguish British and American singers.

Other pronunciation differences exist in stress patterns and in consonant and vowel articulation and distribution. Those differences have been described in fine detail. Vocabulary differences have been very widely noted between the two varieties, and they are fairly extensive, although also often subtler than most lists of supposed equivalences account for. Popular awareness probably centers more on lexical differences than on any other sort, partly perhaps because they are the easiest for the layperson to notice. Subtle differences of national style also exist, but have been but little and only incidentally noted (Algeo 1989, Heacock and Cassidy 1998).

Grammatical differences have been treated, but mainly by individual scholarly studies focused on particular grammatical matters. Extensive and comprehensive treatment is rare. Popular writers on grammar are aware that British and American differ in their morphosyntax but tend to be sketchy about the details. Anthony Burgess (1992), who is one of the linguistically best informed men of letters, settled on a few verb forms as illustrations. The grammatical differences between the two principal national varieties of the language are, however, manifold. Some general treatments of British–American grammatical differences, from various standpoints, are those by Randolph Quirk et al. (1985), John Algeo (1988), Michael Swan (1995), Douglas Biber et al. (1999), Rodney Huddleston and Geoffrey Pullum (2002), Gunnel Tottie (2002, 146–78), Peter Trudgill and Jean Hannah (2002), and Pam Peters (2004).

Although many, few of the grammatical differences between British and American are great enough to produce confusion, and most are not stable because the two varieties are constantly influencing each other, with borrowing both ways across the Atlantic and nowadays via the Internet. When a use is said to be British, that statement does not necessarily mean that it is the only or even the main British use or that the use does not occur in American also, but only that the use is attested in British sources and is more typical of British than of American English.

The basis of this study

A distinction is often drawn between intuition and data as the basis for statements about language. That dichotomy, like most others, is false. Intuition is needed to identify matters to comment on, and data is (or, as the reader prefers, are) needed to substantiate intuition. My wife and I have spent twenty years
gathering citations of what intuition told us were British uses. Then I set out to substantiate those intuitions by consulting corpora of data. In most cases, our intuitions proved correct, and the corpora yielded statistics to support our hunches. In some cases, however, what intuition told us was a Briticism turned out to be nothing of the sort, but instead just to be a rare or peculiar use – rare and peculiar in both British and American English. And in a few cases, we were spectacularly wrong. Linguistic intuition is invaluable but unreliable.

Corpus data is likewise invaluable, but it has its own unreliability. The statistics from any corpus should be used with care and reservations, especially in comparing statistics from different corpora or even statistics derived from the same corpus but in different ways. A bit of folk wisdom has it that there are three kinds of lies: lies, damned lies, and statistics. The problems with statistics based on language corpora include the fact that two corpora may not be comparable because they are of different sizes or because they are composed of different kinds of texts. Academic printed texts and conversational oral texts will have strikingly different characteristics.

The way one phrases a search in a corpus can also produce different results; for example, if the search engine is sensitive to capitalization, asking for examples and statistics of a form with a lower-case initial letter may produce rather different results than a query asking for the same information of the same form, but with an upper-case initial letter. In this study, capitalization was taken into consideration when it seemed potentially influential, but not otherwise.

Moreover, many grammatical items are difficult to find in a corpus unless it has been extensively and accurately tagged, and few corpora, especially the larger ones, have the sort of tagging that would make grammatical searches easy. Instead, one must come up with ways of asking the corpus about instances of something that its search engine can find and that will give at least implicit, albeit incomplete, information about grammatical structures. Thus if one wants information about the form of negation in sentences with indefinite direct objects (They had no money) versus those with definite direct objects (They didn’t have the money needed), barring sophisticated grammatical tagging, it is necessary to ask about particular constructions (such as those just cited) and extrapolate a generalization from them. This study generally eschews such broad extrapolation, but some was unavoidable.

Finally, however, one relies on whatever is available. For the entries in this study, such evidence as was convenient to extract from corpora has been cited. But when that evidence was not readily available, intuition was still used. Any entry with no substantiating evidence is an intuitional guess, as far as its Britishness is concerned. In those, as well as other, cases it is advisable to keep in mind the wise words of Oliver Cromwell to the General Assembly of the Church of Scotland: “I beseech you, in the bowels of Christ, think it possible you may be mistaken.” The author intones those words as a mantra.
4 Introduction

Sources of comparative statistics and citations

Statistics

In the body of this work, several corpora have been used and are cited by name, but the one most used, especially for comparative statistics, is the Cambridge International Corpus (CIC). Statistics from it are sometimes cited as ratios or percentages; in those cases, the base number is of a size to make such form of citation appropriate and easy to follow. CIC statistics are also sometimes cited by an arcane abbreviation: “iptmw,” that is, “instances per ten million words,” which is the way the CIC reports frequencies from its nearly two hundred million words. The accompanying table shows the composition of this great corpus and the relative sizes of its component parts. As can be seen, the British corpus totals 101.9 million words, of which 83 percent are written texts and 17 percent spoken texts; the American corpus totals 96.1 million words, of which 77 percent are written texts and 23 percent spoken texts.

In consulting the CIC, all textual categories were weighted equally, even though only 17 percent of British texts and 23 percent of American texts are spoken versus written, and 11 percent of British written texts and 5 percent of American written texts are academic versus general. That equal weighting emphasizes disproportionately the fewer spoken over written texts and academic over general writing. Different weightings would very likely have produced at least somewhat different results.
Because the focus of this study is not on speech versus writing or academic versus general style, and because British and American are treated alike in this respect, ignoring the differences in text types probably does not greatly affect the general conclusions concerning British versus American use. Thus a statement such as “daren’t is 13.9 times more frequent in British than in American” refers to a combination of spoken and written texts in both varieties, although it is in the nature of things that contractions are more frequent in speech than in writing. That, however, is not the concern of this study.

The CIC is especially useful for a statistical comparison of British and American because of its large size and because it has roughly comparable samples of British and American texts. As mentioned above, statistics from it are often cited in terms of “instances per ten million words” (iptmw). When some form or construction is cited as occurring X times more or less often in one variety than in the other, or in percentages, the basis for that comparison seemed adequate, and that style of comparison easier to understand.

Citations

In keeping with the focus on British English mentioned above, all of the illustrative citations are of British use. Most of them are drawn from a corpus of British examples compiled by Adele and John Algeo over a period of some twenty years. That corpus consists of British citations gathered because they were suspected to contain characteristically British features, chiefly lexical but also some grammatical ones. Most of the citations are from newspapers or popular fiction. The corpus is stored electronically in word-processor format.

Illustrative quotations are generally limited to one for each entry. In many cases the files that underlie this study contain a great many more, but space was not available for them. Several of the chapters depend heavily on prior studies by the author and draw both examples and exposition from articles reporting those studies.

The sources cited are heavily in the genre of mystery novels and other light fiction, chosen because the initial reading was for lexical purposes, and those genres have a rich store of colloquialisms and informal language (in which British-American differences are most pronounced) whereas serious fiction contains fewer such items.

British fiction that has been adapted for American readers provides a useful source to document the words and expressions that publishers change for the American market. In the case of the Harry Potter books, a website (www.hpotlexicon.org/) provides a list of such changes. Quotations from these books in this work note the American adaptation when it was recorded on that site.

Many of the quotations cited here were computerized by graduate assistants at the University of Georgia. They sometimes made mistakes in transcribing a quotation that suggest the quotation’s use was at variance with their own native
6 Introduction

use; such mistakes are occasionally noted as evidence for the Britishness of a particular form.

Examples cited from publicly available corpora are identified appropriately. Those cited from the Survey of English Usage (SEU) have corpus identification numbers preceded by either “s” for spoken or “w” for written.

Conventions and organization of this study

Illustrative quotations are abridged when that can be done without distortion or losing needed context. Matter omitted in the middle of a quotation is indicated by ellipsis points; matter omitted at the beginning of a quotation is indicated only if the retained matter does not begin with a capital letter; matter omitted at the end of a quotation is not indicated.

In the illustrative quotations, periodical headlines have arbitrarily been printed with initial capital letters for each word, as a device to facilitate their recognition.

The abbreviation “iptmw,” which is widely used, has been explained above as meaning “instances per ten million words” in the CIC texts. An asterisk before a construction (as in *go same?) means that the construction is impossible in normal use. A question mark before a construction (as in ?They dared their friends solve the puzzle) means that the construction is of doubtful or disputed possibility in normal use. Cross-references from one chapter to another use the symbol §; thus § 2.2.2.3 means “chapter 2 section 2.2.3”. Abbreviations of titles of dictionaries, grammars, and corpora are explained in the bibliographies of scholarly works and of citation sources.

Studies and dictionaries are cited either by title abbreviations (e.g., CGEL), which are identified in the bibliography, or by author and year (e.g., Peters 2004). Citation sources are cited by date and author (e.g., 1977 Dexter) and short title, if necessary (e.g., 1937 Innes, Hamlet) or by periodical date and title (e.g., 2003 June 12 Times 20/2; for location in a periodical, “2 4/2–3” means “section 2, page 4, columns 2 to 3”).

In headwords and glosses to them, general terms representing contextual elements are italicized, e.g., pressurize someone means that the verb pressurize takes a personal object.

A comment that a construction is “rare” means that the Algeo corpus contains few examples, often only one, and that CIC has no or very few instances of it. Such constructions are included because they illustrate a pattern. The term “common-core English” designates usage common to the two varieties, British and American, and not differing significantly between them.

Of the seventeen following chapters, the first ten deal with parts of speech, and the final seven with matters of syntax or phrase and clause constructions. Because the verb is central to English grammatical constructions, it is considered in Chapter 1. Thereafter, the elements of the noun phrase are taken up: determiners, nouns, pronouns, and adjectives. Adverbs and qualifiers (i.e., adverbs of degree) follow, succeeded by prepositions and conjunctions, with the highly
miscellaneous category of interjections coming last in the chapters on parts of speech.

In the chapters on syntactic constructions, no effort is made to treat all matters of English syntax, most of which vary little between British and American use. Instead, chapters have been devoted to those relatively few syntactic matters that do show significant differences between the two national varieties: complementation (*agree [on] a plan*), mandative constructions (*insisted he was/be there*), expanded predicates (*have/take a bath*), concord (*the team have/has won*), propredicates (*I haven’t finished but I could [do]*), tag questions (*he would, wouldn’t he?*), and other constructions, such as focusing (*it’s right tasty, is Webster’s*).
I

Parts of Speech
1 Verbs

1.1 Derivation

British has some verbs lacking or comparatively rare in American, many of which are denominal.

bath  Bathe: In CIC British texts, *bathe* is 5 or 6 times more frequent than *bath* as a verb, whereas the verb *bath* is very rare in American use, *bathe* occurring about 40 times more often. 1. *intransitive* Wash oneself in a (bath) tub <We must all *bathe* twice a day.> 1990 Aug. 13 *Times* 10/2. 2. *transitive* Wash (someone) in a (bath) tub <He got her to *bathe* herself.> 1992 Dexter 292.

Note: In common-core English use, transitive *bathe* also means “apply water or other liquid to something to clean or soothe it,” but in British English it does not usually mean “wash someone in a bath,” for which *bath* is used; that difference in meaning explains the following: <“Is it all right” she asked. “Not gone gangrenous, has it? I can’t see very well.” [¶] I assured her it wasn’t gangrenous, that I’d *bathe* it and that it would be better left exposed. [¶] She misunderstood or pretended to. “A bath,” she said. “I haven’t had a bath for two years. I need someone to get me out. You’ll *bath* me.”> 1991 Green 40.

beast  Behave like a beast: The verbal use of *beast* is very rare. < . . . provost sergeants appear at work at 8am and don’t stop shouting, bullying and *beasting* until they clock off at 4.30.> 1995 Aug. 28 *Independent* 2 7/5.

bin  Trash; junk; put into a bin “trash can”: The noun *bin* is not used in American English of a container for trash, so no corresponding verb exists. <Junk mail? Don’t *bin* it, enjoy it.> 1990 Aug. 20 *Evening Standard* 22/3–4.

burgle  Burglarize: *Burgle* is frequent in British use; CIC has no tokens of British *burglarize*. Both forms are used in American, but *burglarize* is about 20 times more frequent than *burgle*. Of a random CIC sample of 250 tokens of British *burgle*, 96 were active and 154 were passive; of the active uses, 57 had places as their objects, 3 had persons, 11 had things (*burgle a radio*), abstractions (*burgle a victory*), or were indeterminate, and 25 were intransitive. Of the passive uses, 1 applied to a thing, 56 to places, and 97 to persons. Thus the verb is more likely to be passive than active, and when active to take a noun of place as
12 Parts of Speech

its object, but when passive to have a personal noun as subject. <But if they burgle a country house, they can be miles away in minutes.> 1994 Sept. Tatler 147/1. <People over 60 who are burgled are more likely to die or be moved into residential care.> 2003 June 26 Guardian international ed. 8/7.

cellar wine Stock wine in a cellar: This use is rare though recorded in both NODE and MW. <... we have not been in the habit of cellaring Rhone reds.> 1987 July Illustrated London News 70/3.

cellaring

cellaring

chair Carry on the shoulders of a group as an acclamation: This use is identified as British in MW and NODE. <And the choir themselves were being chaired round the cricket pitch – -> 1988 Trollope 217.

chair

check Be cheeky [impudent] toward: CIC has 0.6 iptmw of the verb in British texts and none in American texts. <Thersites was not a traitor, but a rank officer in the Iliad, who got a bloody nose for checking other officers.> 1998 Jan. 3 Times Metro 17/2. Cf. § 5.2 CHEEKY.

check

pressurize someone Pressure someone: CIC American tokens of pressurize outnumber British by 2 to 1, but of all the American tokens, only 3 have personal objects; on the other hand, two-thirds of the British tokens have personal objects, with which American would use the verb pressure. <She could have arranged to meet her lover ... to pressurize him into marriage.> 2003 James 342.

pressurize someone

sculpture Sculpt: CIC has 4.5 times as many tokens of sculpt as of the verb sculpture in British texts, but 7.5 times as many in American texts. Although sculpt is the usual verb in common-core English, to sculpture is relatively more frequent in British. <Even tiny plastic chocks of Lego can be agglomerated to make a sculptured figure.> 1991 Apr. 25, Evening Standard 23/3.

sculpture

slob CIC has 0.6 iptmw of this verb in British texts and none in American. <She [Camilla] ... can go home to Wiltshire and slob in front of the television without the butler spying on her.> 2004 Dec. 15 Daily Telegraph 18/6.

slob

treble Triple: CIC has about 1.3 times as many treble as triple in British texts, and 18 times as many triple as treble in American texts. <... the figure could easily be doubled or trebled.> 1989 July 28 Times 2/1.

treble

workshop a play Perform a play for the purpose of critiquing and improving it: This use is rare (it is in NODE, but not MW). <Yasmin was written by Simon Beaufoy ... and nobody can question the nobility of his motives in “workshopping” it first with the Muslim community in northern England.> 2005 Jan. 14 Daily Telegraph 33/1–2.

workshop a play

1.2 Form

1.2.1 Principal parts

The inflected forms of verbs show some variation, with the irregular -t forms used more in British than they are in American (Johansson 1979, 205–6; LGSWE 396;
