

Contents

<i>Notation</i>	x
1 Introduction	1
2 The analysis of stress and strain rate	7
2.1 Introduction	7
2.2 Force, stress and pressure	7
2.3 Two-dimensional stress analysis – Mohr’s circle	9
2.4 The stress gradient and Euler’s equation	16
2.5 Mohr’s circle for rate of strain	18
3 The ideal Coulomb material	21
3.1 Introduction	21
3.2 The Coulomb yield criterion	21
3.3 The Mohr–Coulomb failure analysis	25
3.4 The Rankine states	30
3.5 The angle of repose of a cohesionless material	36
3.6 The angle of repose of a cohesive material	38
3.7 The wall failure criterion	40
4 Coulomb’s method of wedges	47
4.1 Introduction	47
4.2 Force exerted by a cohesionless material on a vertical retaining wall	47
4.3 Force on a retaining wall – passive analysis and discussion	53
4.4 Inclined walls and top surfaces	57
4.5 Numerical and graphical methods	60

viii	<i>Contents</i>	
4.6	Accuracy of Coulomb's method of wedges	63
4.7	Effect of a surcharge	68
4.8	Twin retaining walls	78
5	The method of differential slices	84
5.1	Introduction	84
5.2	Janssen's original analysis	84
5.3	Walker's improvement of Janssen's analysis	90
5.4	Walker's distribution factor	93
5.5	Vertical walled bunkers of arbitrary cross-section	98
5.6	The active and passive solutions	101
5.7	Inclined top surfaces	104
5.8	Conical and wedge-shaped hoppers	106
5.9	Walter's switch stress analysis	116
5.10	Analyses of Enstad and Reimbert	122
6	Determination of physical properties	127
6.1	Introduction	127
6.2	Density and compressibility	128
6.3	Particle size	134
6.4	Permeability	143
6.5	Measurement of the internal failure properties	146
6.6	Interpretation of shear cell results	156
6.7	Wall frictional properties	161
7	Exact stress analyses	163
7.1	Introduction	163
7.2	Basic equations	164
7.3	Particular solutions	169
7.4	The radial stress field	181
7.5	Assessment of the method of differential slices	187
7.6	The method of characteristics	190
7.7	Single retaining wall with surcharge	199
7.8	Single retaining wall with zero or very large surcharge	207
7.9	Inclined top surfaces, inclined walls and cohesive materials	213
7.10	Twin retaining walls	217
7.11	Characteristic equations in non-Cartesian co-ordinate systems	223

<i>Contents</i>		ix
7.12	The stress discontinuity	227
7.13	Switch stresses	236
8	Velocity distributions	243
8.1	Introduction	243
8.2	Kinematic models	246
8.3	The yield function, the plastic potential and flow rules	251
8.4	Particular solutions, the radial velocity field	257
8.5	The mass/core flow criterion	262
8.6	The method of characteristics	265
8.7	The velocity discontinuity	272
9	The Conical yield function	277
9.1	Introduction	277
9.2	The Conical yield function	278
9.3	Levy's flow rule	283
9.4	The radial stress and velocity fields	286
10	The prediction of mass flow rate	292
10.1	Introduction	292
10.2	Mass flow rate correlations	292
10.3	The free-fall arch and the minimum energy theory	298
10.4	The hour-glass theory	301
10.5	Rough-walled hoppers	306
10.6	Air-augmented flows	310
10.7	The flow of fine powders	319
10.8	Cohesive arching	322
10.9	Flooding	326
	Set problems – chapters 2–10	329
	Appendices	338
1	Resolution of forces and stresses by matrix or tensorial methods	338
2	Euler's equation and rates of strain	341
3	Mohr's circle for rate of strain	344
	<i>References and bibliography</i>	346
	<i>Index</i>	349
