	<i>Preface</i>	xi
1	Introduction	1
	1.1 Origins of optical nonlinearity	1
	1.2 Effects arising from the quadratic polarisation	6
	1.3 Effects arising from the cubic polarisation	8
	1.4 Summary of the book	10
2	The constitutive relation	12
	2.1 Time-domain response functions	12
	2.1.1 Linear response	13
	2.1.2 Quadratic nonlinear response	14
	2.1.3 Higher-order nonlinearity	16
	2.2 Frequency domain – the susceptibility tensors	17
	2.2.1 The complex frequency plane	17
	2.2.2 Linear susceptibility	19
	2.2.3 Second-order susceptibility	20
	2.2.4 <i>n</i> th-order susceptibility	21
	2.3 Superposition of monochromatic waves	21
	2.3.1 Fourier components of the polarisation	21
	2.3.2 Polarisation induced by monochromatic waves	23
	2.3.3 Conventions and catalogue of nonlinear phenomena	24
	2.3.4 Scalar form of the susceptibilities	27
	2.4 Time-dependent problems	28
	2.4.1 Quasi-monochromatic waves	29
	2.4.2 The adiabatic limit	31
	2.4.3 The transient limit	31
	2.5 Spatial dispersion	32
	2.6 Alternative approaches	34
3	Review of quantum mechanics	37
	3.1 Basic concepts	37
	3.2 Representations and matrices	38
	3.2.1 Representations	39
	3.2.2 Matrix representation of operators	39
	3.2.3 Hermitian operators	40
	3.3 Traces	41

<i>vi</i>	<i>Contents</i>	
	3.4 The projection operator	43
	3.5 The density operator	44
	3.5.1 Equation of motion	45
	3.5.2 Thermal equilibrium	46
	3.6 The energy representation	48
	3.7 A perturbation series for the density operator	48
	3.7.1 Outline	49
	3.7.2 Time-development operators	50
	3.7.3 The interaction picture	53
	3.7.4 The end result	54
4	The susceptibility tensors	56
	4.1 A general charged-particle distribution	56
	4.1.1 The macroscopic polarisation	56
	4.1.2 Linear susceptibility	58
	4.1.3 The nonlinear susceptibilities	60
	4.2 Explicit formulae for an assembly of independent molecules	61
	4.3 Overall permutation symmetry	70
	4.3.1 Compact formulae for nonresonant susceptibilities	70
	4.3.2 Third-harmonic generation	74
	4.3.3 Virtual transitions and Feynman diagrams	75
	4.4 The passage from microscopic to macroscopic formulae	76
	4.4.1 Induced molecular dipole moment	77
	4.4.2 The local field	79
	4.4.3 Macroscopic polarisation and orientation average	85
	4.5 Resonant susceptibilities	87
	4.5.1 Resonance enhancement	87
	4.5.2 Two-photon resonances	94
	4.5.3 Secular resonances	101
	4.5.4 The Born-Oppenheimer approximation: electronic, vibrational and hybrid resonances	102
	4.6 Mobile charged particles in solids	105
	4.6.1 Susceptibility formulae in terms of current operators	106
	4.6.2 Derivation of the alternative formulae: Current density and the conductivity tensors	109
	4.7 Semiempirical approximations and models	112
	4.7.1 Resonant case	113
	4.7.2 Unsöld approximation and charge models	114
	4.7.3 Miller's delta	117
	4.7.4 Sum over states	118
	4.7.5 Finite-field method	121

<i>Contents</i>	<i>vii</i>
5 Symmetry properties	122
5.1 Permutation symmetry	122
5.1.1 Physical consequences of overall permutation symmetry	123
5.1.2 Contracted susceptibility tensors for second-order processes	128
5.2 Time-reversal symmetry	131
5.3 Spatial symmetry	134
5.3.1 The transformation laws and Neumann's principle	135
5.3.2 Reduction of the susceptibility tensors: The analytical and direct-inspection methods	137
5.3.3 Group-theoretical methods	142
5.3.4 Results for isotropic media and the 32 crystal classes	143
5.3.5 Free atoms and rotating molecules	145
5.3.6 Microscopic and macroscopic symmetries	149
6 Resonant nonlinearities	150
6.1 Quasi-monochromatic fields	151
6.1.1 Adiabatic response	152
6.1.2 Adiabatic condition violated	154
6.1.3 Equivalent susceptibility in the transient regime	155
6.2 Resonant two-level systems	156
6.2.1 The two-level atom	157
6.2.2 Equations of motion for the density matrix elements	159
6.2.3 Rotating-wave approximation	161
6.2.4 The macroscopic polarisation	163
6.2.5 Relaxation	164
6.2.6 Steady-state and rate-equation regimes	165
6.2.7 The vector model	166
6.2.8 Adiabatic-following regime	172
6.3 Intensity-dependent refractive index	173
6.3.1 The field-corrected susceptibility	174
6.3.2 A two-level saturable absorber	176
6.3.3 Optical Stark effect	181
6.3.4 Inhomogeneous broadening	184
6.4 Multiple driving fields	189
6.5 Multi-photon resonances	196
6.5.1 Classical model	196
6.5.2 Effective two-level Hamiltonian	200
6.5.3 Stimulated Raman scattering – the links between the different approaches	203
6.6 Summary of mechanisms and time regimes in nonlinear optics	207

<i>viii</i>	<i>Contents</i>	
7	Wave propagation and processes in nonlinear media	211
7.1	Coupled wave equations	211
7.1.1	General form	211
7.1.2	Wave propagation in the linear regime	212
7.1.3	Nonlinear regime	214
7.1.4	Slowly-varying envelope approximation	216
7.1.5	Monochromatic waves	217
7.1.6	Time-dependent processes	218
7.2	Parametric processes	220
7.2.1	Harmonic generation	220
7.2.2	Frequency mixing and parametric amplification	226
7.3	Processes independent of phase matching	228
7.4	Degenerate four-wave mixing and phase conjugation	232
7.5	Self-phase modulation and solitons	236
8	Dynamic optical nonlinearities in semiconductors	246
8.1	The electronic band structure of Group IV and III–V semiconductors	247
8.2	Phonons in Group IV and III–V semiconductors	251
8.3	Linear-optical properties	252
8.3.1	The linear susceptibility	252
8.3.2	Intraband free-carrier effects	253
8.3.3	Interband absorption in the one-electron approximation	255
8.3.4	The exciton line spectrum	258
8.4	Nonlinear-optical properties	262
8.4.1	Calculation of the quasi-Fermi levels in the presence of an optical pump	263
8.4.2	Intraband free-carrier effects	264
8.4.3	Interband absorption effects	265
8.4.4	Exciton effects in the nonlinear regime	270
9	The optical properties of artificial materials	275
9.1	Quantum wells	277
9.1.1	Electronic structure	277
9.1.2	Single-particle absorption spectrum	280
9.1.3	Exciton line spectrum	282
9.1.4	Quantum-confined Stark effect	285
9.1.5	Nonlinear exciton absorption	287
9.2	Quantum dots	288
9.2.1	Electronic structure	288
9.2.2	Linear-optical properties of semiconducting quantum dots	289

<i>Contents</i>	<i>ix</i>
9.2.3 Nonlinear-optical properties of semiconducting quantum dots	290
9.2.4 Metallic quantum dots	293
Appendices	
1 Universal constants	295
2 Relations between esu and SI units for the susceptibilities	296
3 Tables of electric-dipole susceptibility tensors for isotropic media and the crystal classes	298
4 Tables of d -tensors and d_{eff} -coefficients for the crystal classes	303
5 Relations between n_2 and $\chi^{(3)}$	306
6 The envelope-function approximation	309
7 k · p theory of a standard semiconductor with a small energy gap	312
8 The Kramers-Kronig dispersion relations	314
9 Electric-multipole and magnetic interactions	316
10 Gaussian beam optics	319
<i>Glossary of mathematical symbols</i>	321
<i>Bibliography</i>	329
<i>Subject index</i>	336
