## SUBJECT INDEX

- added counterions, *see* electrical conductivity
- added mass, 43, 70
- adhesive excluded shell potential
  - calculation of parameters, 364–5
  - definition, 335
  - diffusion coefficient, 433, 435, 450–1
  - nonequilibrium microstructure, 491–2
  - osmotic pressure, 335
  - radial distribution function, 335
  - sedimentation, 401–3
  - viscosity, 498–500
- admittance, *see* dielectric relaxation
- adsorbed polymer layers
  - amount, 197, 198, 199, 200
  - desorption, 195, 201
  - equilibration, 195, 201, 205
  - interactions, 201–5
  - structure, 194–5, 198
  - thickness, 200–1
  - see also* force measurements
- aerosols, 366
- aggregation, *see* flocculation, stability boundaries
- albumin, 7
  - see also* bovine serum albumin
- Ampere's law, 143
- attraction number, 371, 372, 377
- autocorrelation function
  - light scattering, 74–5, 442–4
  - velocity, 67, 71, 78
- batch settling, 411–14
  - finite Peclet number, 423–4
  - infinite Peclet number, 414–22
- Berzelius (1779–1848), 8
- block copolymers, *see* copolymers
- body forces, 22
- Boltzmann distribution
  - of internal energies, 170
  - of ions, 99, 100, 344
  - of particles in external potential, 438
  - of polymer segments, 174
- boundary layers, in particle capture, 384
- bovine serum albumin, 7
  - diffusion coefficient, 434–7
  - viscosity, 499, 501
- Bragg diffraction, 1
  - see also* iridescence
- Brown, Robert (1773–1858), 8
- Brownian dynamics, 82–4
- Brownian force
  - effective, 265, 494, 496–7
  - fluctuating, 67, 77, 79
- Brownian stress, 497
- capacitor, charge on a, 90–2
- capture efficiency and coefficient, *see* particle capture
- Carnahan–Starling equation, 338, 435
- characteristics, method of, 412–13
- charged spheres
  - diffusion coefficient, 433–5, 451–2
  - disorder–order transition, 343–8
  - effective hard sphere diameter, 345, 346, 353, 474
  - electrostatic field around, 90, 109–11
  - interparticle force, 115–19
  - interparticle potential, 119–20
  - nonequilibrium microstructure, 490–1, 492
  - osmotic pressure, 335
  - shear viscosity, 471–4, 476–7
  - static modulus, 474–6
  - see also* adhesive excluded shell potential, dielectric relaxation, electrical conductivity, electrophoresis, flocculation, phase diagrams

 for particle capture, 370–4  
 for phase separation, 329–30  
 for polymers in solution, 164–7  
 for rheology, 464–5  
 for sedimentation, 395, 407, 412–14
- scaling theories, 168, 189, 192, 205
- Schulze–Hardy rule, 262
- secondary minimum, *see* flocculation, particle capture
- second virial coefficients  
 diffusion, 432, 447  
 osmotic pressure, 334, 335  
 sedimentation, 401–02, 405  
 viscosity, 466, 477, 498–502
- sedimentation coefficient  
 definition, 412  
 effect of polydispersity, 405–10  
 experimental results, 401, 402, 403, 404, 408, 410  
 generalized, 440  
 role in diffusion, 430  
*see also* adhesive excluded shell model, hard spheres, lattices
- sedimentation number, 371, 385

524 *Index*

- self-consistent field theory  
 adsorbed layers, 196–8  
 boundary condition, 78, 196  
 bulk solutions, 176  
 depletion layers, 190–2  
 field equation, 174, 176, 178, 197  
 field, 175  
 formulation, 172–6  
 Helmholtz free energy, 175  
 ideal anchored chains, 178–9, 181–2  
 segment density, 174, 178, 191, 197  
 self-intermediate scattering function, 443, 446–7  
 semi-dilute solutions, *see* polymer solutions  
 settling velocity of a sphere, 63, 395  
 shear melting, 1  
*see also* order–disorder transitions  
 shear modulus, 459–61, 462–3, 464, 465, 470–1, 482, 486  
 silica spheres  
 compressibility factor, 338–9, 340  
 crystallization, 343  
 diffusion coefficient, 433, 448–9  
 flocculated, 325–6, 328  
 model colloids, 9  
 phase separated by dissolved polymer, 357–8  
 rheology, 466–71  
 sedimentation coefficient, 401  
 silver iodide, 97, 98  
 simple fluid, 459  
 singular solutions  
 to Laplace's equation, 89, 130  
 to the Stokes equations, 31–5, 495  
 slow (reaction limited) flocculation, 267, 272, 277–9, 284, 286, 287  
 Smoluchowski, Marian von (1872–1917), 8  
 sols, *see* gold sol, latices, silica, silver iodide  
 speed of light, 133, 135, 136, 143  
 spinodal decomposition, 365  
 square well potential, 506  
 stability boundaries  
 polymerically stabilized spheres with dissolved polymer, 357–60  
 shear induced flocculation, 299–302  
*see also* phase boundaries  
 stability ratio  
 for Brownian flocculation, 267, 270, 271–4, 275–9  
 for shear flocculation, 296, 297, 298, 304  
 stabilization, *see* flocculation  
 stagnation point, 29–30  
 static modulus, 462, 463, 473–6, 478, 483–6, 503  
 static structure factor, 438–9, 446, 448, 451  
 steady shear flow, 25–7, 458  
 Stern layer, 100  
 lateral migration of ions in, 238  
 Stokes doublets, 34  
 Stokes equations, 30  
 characteristics of, 30–1  
*see also* singular solutions  
 Stokeslet, 34  
 Stokes number, 371, 372–3, 375–7  
 Stokes velocity, 395  
 strain tensor, 462  
 stream function  
 axisymmetric potential flow, 29  
 axisymmetric viscous flow, 369  
 streaming potential, 212–14  
 streamlines  
 grazing, 369  
 potential flow past a sphere, 29  
 shear flow past a sphere, 39–41  
 stresslet, 34  
 stress  
 Brownian, 497  
 bulk/macrosopic, 37, 493–7  
 hydrodynamic, 497  
 interparticle, 497  
 normal, 459  
 tensor, 23  
 vector, 22  
 surface potential  
 Galvani, Volta,  $\chi$ , 98  
 of silver iodide particles, 98  
 tails, 195, 198  
 Taylor diffusion column, 433  
 terminally anchored chains  
 at ideal conditions, 177–9  
 in good solvents, 177, 179–81  
 in poor solvents, 179–81  
 interactions at ideal conditions, 181–2  
 interactions in good solvents, 182–6  
 interactions in poor solvents, 184, 186, 316–18  
 layer thickness, 180, 184  
*see also* force measurements  
 thermodynamic force, 412, 414, 423, 430  
 thermodynamic pressure, 169–70  
 thermodynamic of dispersions  
 as pseudo-one-component systems, 333–4  
 statistical mechanics, 332–3  
*see also* polymer solutions  
 thermodynamic stress, 494, 496–7  
 theta state, *see* polymer solutions  
 time scales  
 diffusion, 442  
 for doublet breakup, 329, 330  
 for doublet formation, 269, 270, 296

- for relaxation of a visco-elastic fluid, 462
- viscous relaxation, 42, 70, 459
- torque
  - on a doublet, 52–3
  - on an isolated sphere, 36
  - on a particle, 31
  - on interacting spheres, 56
- trains, 194–5, 198
- trajectories, particle, 52, 57–9, 490, 492
  - governing equations, 45, 53, 293
  - see also* particle capture
- transition probability, 69
- triple point, 353
- turbidity, 275, 320
- ultrafiltration, 431–2
- ultramicroscope, 8, 70
- van der Waals forces, 129, 165
  - see also* dispersion forces, Hamaker constant
- van't Hoff's law, 166
- vector potential, electromagnetic theory, 143
- velocities of interacting spheres
  - in a quiescent fluid, 44, 49
  - in a shear flow, 53
- velocity fields around a sphere, 37–9
- virial expansion, *see* second virial coefficient
- viscoelasticity, 459–61, 462–4
- viscosity
  - dynamic, 458–63, 464, 465
  - effective, for shear, 458–61
  - extensional, 500
  - for dilute suspension of spheres, 37
  - for polymerically stabilized spheres, 477–81
  - Newtonian, 23, 462
  - see also* adhesive excluded shell potential, charged spheres, hard spheres
- viscous relaxation time, 42
- volume fraction
  - definition, 265
  - equivalent hard sphere, 346, 477
- vorticity, 39, 70
- yield stress, 485
- zeta potential, 8, 213–15
  - definition, 213
  - in dielectric relaxation, 246, 247, 248, 249
  - in electrical conductivity, 234, 235–8
  - relation to electro-osmosis, 214–15
  - relation to electrophoresis, 222, 223–31
  - relation to streaming potential, 212–14
