<i>Foreword</i>	xxi
<i>Acknowledgments</i>	xxix
1. Introduction and preview	1
Why should one study intelligence in adulthood?	3
History of the Seattle Longitudinal Study	6
Objectives of the Seattle Longitudinal Study	12
Plan for the volume	15
Chapter summary	17
2. Methodological issues	18
Cross-sectional and longitudinal data	18
Simple data collection designs	19
Sequential data collection designs	21
Longitudinal sequences	24
Threats to internal and external validity	26
Longitudinal studies as quasi-experiments	26
Internal validity	26
External validity	29
Schaie’s “most efficient design”	29
Repeated measures versus independent samples	31
What analyses can be conducted on successive measurement occasions?	32
Structural equivalence	33
Observed variables and latent constructs	33
Structural equivalence across comparison groups	34

vi	<i>Contents</i>	
	Structural equivalence across time	35
	Chapter summary	36
3.	The database	37
	The subject population	37
	The cross-sectional sequence	38
	The longitudinal sequences	39
	Characteristics of the base population	42
	The measurement battery	48
	The cognitive ability battery	50
	Measures of self-reported cognitive change	54
	Measures of everyday problem solving	54
	Measures of cognitive style	55
	Descriptions of lifestyles and demographic characteristics	56
	Descriptions of health status	57
	Descriptions of the subjective environment	58
	Personality traits and attitudes	59
	Chapter summary	60
4.	Cross-sectional studies	61
	The pilot studies	61
	Study 1: Suitability of the PMA tests for adults	62
	Study 2: Suitability of the PMA tests for older adults	63
	Study 3: TBR construct validity	65
	The 1956 baseline study	68
	Cross-sectional replications	69
	Basic cognitive data	69
	Expanded cognitive data	81
	Age-difference patterns within ability domains	83
	Cross-sectional differences on the latent constructs	95
	Practical intelligence data	96
	Cognitive style data	99
	Chapter summary	101
5.	Longitudinal studies	107
	Basic cognitive data	108
	Seven-year data	108

<i>Contents</i>	vii
Fourteen-year data	114
Twenty-one-year data	114
Twenty-eight-year data	116
Thirty-five-year data	116
Expanded cognitive data	120
Observed variables	120
Latent constructs	126
Practical intelligence data	129
Cognitive style data	131
Chapter summary	131
6. Studies of cohort and period differences	137
Studies of cohort differences	137
Cohort differences in cognitive abilities	138
Cohort differences for the measure of practical intelligence	152
Cohort differences in cognitive styles	153
Cohort differences in demographic characteristics	156
Studies of period (time-of-measurement) differences	160
Period effects for the cognitive abilities	162
Period effects for the cognitive styles	162
Period effects in demographic characteristics	165
Interpretation and application of period effect estimates	165
Chapter summary	169
7. Intervention studies	171
Remediation versus new learning	171
The 1983–1984 cognitive training study	173
Method	173
Training programs	176
Results of the 1983–1984 training study	177
What is the benefit of cognitive training?	183
Decomposing training effects into gains in accuracy and speed	186
Seven-year follow-up studies	189
Method	190
Results of the follow-up study	190

viii	<i>Contents</i>	
	Replication of cognitive training effects	194
	Chapter summary	195
8.	Methodological studies	198
	Changing from sampling without replacement to sampling with replacement (1974 collateral study)	199
	Method	200
	Findings from the sampling equivalence study	202
	The aging of tests (1975 study)	204
	Method	206
	“Aging of tests” study findings	207
	Effects of monetary incentives	209
	Method	211
	“Monetary incentives” study findings	212
	Effects of experimental mortality: the problem of subject attrition	213
	Effects of practice in repeated testing	215
	Structural equivalence	217
	Factorial invariance across samples differing in age	217
	Factorial invariance across experimental interventions	223
	Factorial invariance with samples across time	226
	Chapter summary	233
9.	The relationship between cognitive styles and intellectual functioning	235
	Does flexibility–rigidity represent an independent domain?	235
	Confirmation of the TBR factor structure	236
	Confirmation of the cognitive factor structure	236
	Confirmation of distinct domains	238
	Does rigidity–flexibility affect the maintenance of intellectual abilities into old age?	242
	Concurrent relationships	242
	Predictors of future ability level	242
	Relationships between the latent ability constructs and the cognitive style measures	244
	Concurrent relationships	247

<i>Contents</i>	ix
Predictors of future ability level	248
Chapter summary	249
10. Health and maintenance of intellectual functioning	250
The analysis of health histories	250
Incidents and episodes	251
Severity ratings	251
Age and health histories	252
How meaningful is the disease model?	252
Health breakdown and cognitive functioning	253
Diseases that affect maintenance of cognitive functioning	254
Cardiovascular disease and intelligence	254
Application of structural equations methods to the study of relationships between disease and cognition	255
More comprehensive recent analyses	256
Disease occurrence	256
Impact of disease on cognitive functioning	257
Intellectual functioning as a predictor of physical health	261
Chapter summary	263
11. Lifestyle variables that affect intellectual functioning	265
Lifestyle characteristics and cognitive functioning: initial analyses	267
Lifestyle characteristics and cognitive functioning: more recent analyses	267
Dimensions of leisure activities	268
Relationship between leisure activities and cognitive functioning	270
Dimensions of the Life Complexity Inventory	270
Correlation of lifestyle factors and intellectual abilities	271
Longitudinal analyses of the lifestyle variables	274
Effects of retirement on the lifestyle variables	275
Chapter summary	276

x	<i>Contents</i>	
12.	The sequential study of personality traits and attitudes	278
	Social Responsibility	278
	Cross-sectional findings	279
	Longitudinal findings	279
	Cohort and period effects	279
	Other personality traits	281
	A classification model for personality traits	284
	Recent analyses of the personality data	287
	Age, gender, and cohort differences in personality traits and attitudes	289
	Age changes in personality traits	291
	Chapter summary	293
13.	Family studies of intellectual abilities in adulthood	296
	Married couples	296
	Method	297
	Results of the couples study	298
	Parents and adult offspring	298
	Relevance of the SLS to developmental behavior genetics	299
	Developmental behavior genetics and adulthood	299
	Method	304
	Results of the parent–offspring study	307
	Adult siblings	325
	Sibling correlations	325
	Stability of sibling correlations over time	326
	Summary and conclusions	326
	Chapter summary	327
14.	Subjective perceptions of cognitive change	329
	Perception of cognitive change over seven years	330
	Method	330
	Results	332
	Summary and conclusions	339
	Perception of short-term cognitive change and of training effects	342
	Method	343

<i>Contents</i>	xi
Results	344
Chapter summary	348
15. Summary and conclusions	349
The course of adult intellectual development	349
Does intelligence change uniformly through adulthood, or are there different life course ability patterns?	350
At what age is there a reliably detectable decrement in ability, and what is its magnitude?	352
What are the patterns of generational differences, and what is their magnitude?	353
What accounts for individual differences in age-related change in adulthood?	354
Intervention in adult intellectual development	357
Family similarity in adult intellectual development	359
What do we still need to learn?	360
