<b>1 Man and plants: a relationship in crisis</b>	<b>1</b>
Résumé	1
Wild plants and plant communities are constantly changing	2
Genetic variation and sex are the keys to adaptive change	3
Natural ecosystems are being destroyed by human population increase and industrialisation	4
Public awareness of environmental destruction is growing	6
Genetic diversity of crop plants is at risk	9
<b>The genetic resources of crop plants</b>	<b>11</b>
Résumé	11
What are the genetic resources of crop plants?	11
Crop plants and human societies evolved together	12
Crops evolved from wild species	15
Dispersion of crops depends on adaptation to new habitats	28
Plant breeding has resulted in genetic erosion as well as crop improvement	30
Collecting becomes the concern of international organisations	35
<b>3 Genes to the rescue</b>	<b>37</b>
Résumé	37
Genetic resources provide solutions to disease epidemics	38
Genes control potato cyst eelworm	39
Rice: high-yielding varieties bring problems	41
Wild species are important in sweet-potato breeding	45
Shorter wheats: bigger yields	47
Host–parasite relations: an evolutionary battleground	51
	vii

viii	<i>Contents</i>	
	Genetic resources are the raw material for the creation of new crops	54
	New crops are needed for different purposes	60
4	<b>Genetic diversity: what needs to be collected?</b>	62
	Résumé	62
	Seeds are ideal natural structures to collect and conserve	63
	Genetic diversity has different levels of organisation	64
	Which types of genetic diversity should we collect?	65
	Priorities in seed collecting	69
	Present status of collections	70
	Further collecting requires collaborative action	77
	The collecting of vegetative material is sometimes necessary	78
5	<b>Safeguarding genetic diversity</b>	81
	Résumé	81
	Collected germplasm has two purposes	82
	Seeds are naturally adapted for storage	83
	The costs of long-term seed storage can be reduced	83
	Some species cannot be stored as seed	85
	<i>Ex-situ</i> seed storage has its critics	88
	Is the proper place to conserve genetic diversity in its natural habitat?	92
6	<b>Managing genetic diversity</b>	100
	Résumé	100
	Why should management be necessary?	101
	Management for security	103
	Good management promotes the use of genetic resources	115
	Core collections: a benefit to curators and breeders	121
	Genetic Resources Accession Assessment Score (GRAAS): a management tool for curators	125
	Crop germplasm networks	126
7	<b>Filling the gaps in the science base</b>	129
	Résumé	129
	Where are the gaps in the science base?	130
	Defining a research programme for the support of crop genetic resources	138
	How can we ensure that the necessary research is done?	139
	The application of research results: technology transfer	141

<b>8</b>	<b>Rising to the challenge</b>	143
	Résumé	143
	The conservation of crop genetic diversity is part of biosphere protection	144
	Organisational issues	145
	Food production and the environment	150
	Population control	152
	<i>References</i>	153
