<i>Preface</i>	xi
1 Purification and crystal growth	1
1.1 Purification	1
Distillation and recrystallisation	2
Continuous chromatography	3
Sublimation	3
Zone-refining	4
1.2 Crystal growth	6
Vapour growth	7
Melt growth	8
Solution growth	9
2 Intermolecular forces	12
2.1 Interaction between dipolar molecules	12
2.2 Dipole-induced dipole interactions	14
2.3 Dispersion forces	14
2.4 Charge-transfer interactions	17
2.5 Repulsive forces	19
2.6 Atom-atom potentials	20
3 Crystal structures	22
3.1 Crystals of non-polar molecules	22
3.2 Crystals of molecules having polar substituents	31
3.3 Structures involving charge transfer	34
3.4 Charge-transfer salts	39
3.5 Self-assembly	43
Langmuir-Blodgett films	43
Use of functional groups to introduce self-assembly properties	45
3.6 Analysis of structural trends using crystallographic databases	46
4 Impurities and defects	50
4.1 Effects of impurities on crystal properties	50
4.2 Types of structural defect	52

viii	<i>Contents</i>	
	Point defects	52
	Line defects or dislocations	53
	Planar defects or stacking faults	56
	Crystal twinning and grain boundaries	58
	Structural disorder	59
4.3	Characterisation of impurities	61
4.4	Characterisation of defects	62
	Optical methods	63
	X-ray topography	64
	Electron microscopy	66
	Scanning probe microscopy	68
	Positron annihilation	70
	5 Molecular motion in crystals	74
5.1	X-ray diffraction studies	74
5.2	Thermodynamic studies	78
5.3	Nuclear magnetic resonance studies	79
	Line-widths	79
	Relaxation times	80
	CPMAS spectra	81
5.4	Nuclear quadrupole resonance studies	83
5.5	Dielectric relaxation studies	84
5.6	Collective motions of molecules in crystals	88
5.7	Neutron-scattering studies	92
5.8	Diffusion in molecular crystals	93
	6 Optical properties of molecular crystals	97
6.1	Methods for measuring absorption spectra of solids	97
6.2	Differences between crystal, solution and gas-phase spectra	102
6.3	The exciton concept	105
6.4	Comparison with experiment	105
6.5	Coherent and incoherent excitons	107
6.6	Types of exciton	108
6.7	Energy transport	110
6.8	Charge-transfer spectra	112
6.9	High-technology applications	116
	7 Chemical reactions in molecular crystals	120
7.1	Non-topochemical reactions in molecular crystals	121
7.2	Influence of crystal-controlled molecular structure on chemical reactivity	122
7.3	Influence of crystal-controlled relative orientation of molecules on chemical reactivity	125
7.4	Controlled topochemical reactions	133
7.5	Control of crystal growth and dissolution	138
7.6	The role of defects	141
	8 Electrical properties	144
8.1	Charge-carrier mobility	144
8.2	The band model	147

<i>Contents</i>	ix
8.3 The hopping model	155
8.4 The tunnel model	157
8.5 Thermal generation of charge carriers	158
8.6 Highly conducting organic solids	169
8.7 Effects of gases on electrical conductivity of molecular crystals	178
8.8 Photoconductivity	183
8.9 Molecular materials in electrophotography, electroluminescence and solar cells	190
9 Special topic: C₆₀	195
9.1 Formation and structure	195
9.2 Crystal structure and phase transitions	198
9.3 Electronic structure	199
9.4 Alkali metal salts	200
9.5 Salts with organic cations	203
9.6 Applications in junction devices	204
9.7 Chemistry of C ₆₀	205
10 Special topic: non-linear optic materials	208
10.1 Molecular design for high second-order NLO coefficients	212
Addition of substituents to prevent centrosymmetric packing	213
Use of Langmuir–Blodgett films	214
Use of poled polymers	214
10.2 Third-order NLO materials	216
<i>Index</i>	219
