ACKNOWLEDGMENTS

THE PLACEMENT OF THESE ACKNOWLEDGMENTS NEAR THE beginning of this book is appropriate because it symbolizes the important role that others have played in making it possible. Chief among these individuals is Brad Huber, who, over the course of two years while a postdoctoral fellow working with me at the University of Pittsburgh, was a tremendous help in assisting in the design of this research, as well as in very capably conducting hundreds of hours of observation and countless interviews. Also important to this research over several years were Debra Evans-Rhodes, then a graduate student in social psychology, who played a significant role in gathering observational data, and Van Yasek, a graduate student in anthropology. The care and patience that they demonstrated in working on the analysis of the interview data made a significant contribution to this project. The able assistance of David Verban, another graduate student in social psychology, was also of great value during the first year of the project. Anthropology graduate students Bernie Harrigan and Mike Rasmussen also made a substantial contribution to this research by conducting dozens of student interviews. Finally, I would like to thank social psychology graduate students Cheri Britt and Rebecca Eurich-Fulcer for their assistance in certain aspects of the data analysis as well as postdoctoral fellow Gail Futoran for her helpful comments on this manuscript and her very useful work on a closely related research project.

Lucille Jarzinka and, at a later point, Debbie Connell were responsible for the daunting job of transcribing the literally thousands of pages of dictated field notes and taped interviews on which this book is based. They both approached this task with care, patience, and intelligence, which I deeply appreciate. In addition, Debbie Connell had major responsibility for organizing this massive data set to prepare it for analysis and for assisting in the

ACKNOWLEDGMENTS

preparation of this manuscript. The infinite patience she evidenced in her work and her remarkable organizational skills saved me hundreds of hours of work and managed to keep things moving when gridlock seemed close to inevitable. For this, as well as for her unfailing good nature, I am profoundly grateful.

A number of undergraduates at the University of Pittsburgh contributed to this project by assisting in the analysis of the interview data. Important in this respect were Bozena Ali, Valerie Balavage, Leslie Gedman, Tammy Kirkpatrick, Hillary Konowal, Donna Liggon, Erin Mamros, Maureen McKissick, Diane Miller, Valerie Morzyellowski, James Omslaer, Saundra Saylor, Amy Schultz, and Amy Woodbury-Webber. I would like to extend a special word of thanks to Haruna Isa, an undergraduate, who during the several years he worked on this project made an unusually fine contribution to many phases of the work.

I would also like to express my appreciation to John Anderson of Carnegie Mellon University and his associates, especially Franklin Boyle, for their willingness to let us observe the field test of the artificially intelligent tutor they developed, as well as meetings of their research group. Their conduct in allowing my research team such unfettered access when they had no prior personal experience with us exemplified scientific ideals of openness and cooperation in the pursuit of knowledge.

I would like to thank Lauren Resnick and Bob Glaser, codirectors of the Learning Research and Development Center, for providing a very supportive environment for my work. Sara Kiesler also deserves a note of thanks for organizing, with the support of the Markle Foundation and the Social Science Research Council, two very fine interdisciplinary conferences that contributed significantly to my thinking in writing Chapter 7.

This book would not have been possible without the cooperation of the teachers and students at the school studied. My deepest thanks to all the teachers who had the courage to open their classrooms day after day to me and the other members of the research team when initially we could tell them little more than that our goal was to see what was happening there and to try to understand the role that technology played in it. It is only a concern about

confidentiality that keeps me from singling out for special recognition the teachers who made a special contribution to this study through their long-term cooperation with our observational work. The willingness of teachers and other school staff members to talk with us about their experiences in both formal interviews and informal conversations was also invaluable, and I am grateful to the large number of individuals who cooperated in this manner. The students who participated in interviews also deserve thanks for taking the time to talk with us so openly. Thanks also to the school district personnel and the parents whose cooperation was essential to the conduct of this research.

My sincere thanks also go to my family: to my mother, Sarah Ellis Ward, and my late father, William Ward, for providing a supportive home environment that valued intellect, excellence, and service to others; to my husband, Douglas, and my daughters, Alanya, Heather, and Emily, for enriching my life by being such good companions when the solitary work of writing is done and we are able to share the day's experiences, take a ride on our bicycles or in a canoe, or set off on journeys to new places. Finally, these acknowledgments would not be complete without thanks to Laurie Sallows, whose friendship over the years and extraordinary helpfulness in so many regards contributed in important ways to creating an environment that made this work possible.

The research reported here was funded by the Office of Naval Research (Contract No. N00014-K-85-0664). I would like to express my appreciation to Susan Chipman, the project monitor, for her insightful comments and unfailing helpfulness. Some of the work that made Chapter 7 possible was funded by a contract with the National Science Foundation (Contract No. RED-9253452). However, all opinions expressed herein are solely those of the author, and no endorsement of the conclusions by the ONR or NSF is implied or intended.

Portions of this book have appeared previously in the articles and book chapters cited here. The material is reprinted with the permission of the publishers indicated:
