<i>Preface</i>		xi

PART I PLANETESIMALS AND STELLAR ENCOUNTERS

1.1 Introduction		3
1.1.1 Nebulae, planetesimals, and the big bump		3
1.1.2 Astrophysics strikes back		9
1.1.3 Intermission		11
1.1.4 A nebula that clumps and coughs?		14
1.1.5 Stars, dust, and protoplanets		17
1.2 A geologist among astronomers: The Chamberlin– Moulton theory		22
1.2.1 Nineteenth-century collision/encounter theories		22
1.2.2 T. C. Chamberlin and the overthrow of the Nebu- lar Hypothesis		24
1.2.3 The assault on the Nebular Hypothesis		27
1.2.4 Competing theories, 1901–1912		44
1.2.5 The planetesimal hypothesis		49
1.2.6 Reception of the planetesimal hypothesis		60
1.3 Jeans, Jeffreys, and the decline of encounter theories		68
1.3.1 Jeans		68
1.3.2 Jeffreys		71
1.3.3 Chamberlin's reaction to Jeans and Jeffreys		71
1.3.4 Decline of the encounter theories		75
1.3.5 Theory change: A test case for historical philoso- phies of science		81

PART 2 NEBULAR REBIRTH AND STELLAR DEATH

2.1 Introduction		91
2.1.1 The Solar System in the first space age		91
2.1.2 Planet formation as a contemporary process		92
2.2 Methodology		95

vi

CONTENTS

2.2.2	Prediction or explanation?	97
2.2.3	Deduction or naturalism?	99
2.2.4	Theory change	100
2.2.5	Scientometrics	102
2.3	Nuclear cosmochronology and Hoyle's research programme	105
2.3.1	Hoyle on the early Sun	105
2.3.2	The Fowler–Greenstein–Hoyle theory	106
2.3.3	Objections to Hoyle's theory	108
2.3.4	Decline of the Fowler–Greenstein–Hoyle theory	109
2.3.5	Decline and transmutation of Hoyle's theory	110
2.4	Cameron's programme	113
2.4.1	Collapsing clouds	113
2.4.2	The viscous accretion disk	116
2.5	Isotopic anomalies and the supernova trigger	119
2.5.1	Magnesium, xenon, oxygen	119
2.5.2	Revival of the supernova trigger	123
2.5.3	Rejection of the trigger hypothesis	126

PART 3 PLANETOGONY AND PLASMA

3.1	Safronov's programme	131
3.1.1	Accretion of particles in the protoplanetary cloud	131
3.1.2	The Americanization of Safronov's programme	135
3.2	The giant planets	139
3.2.1	Gaseous condensation models	139
3.2.2	The Kyoto programme and the nucleation model	141
3.2.3	A crucial test?	142
3.3	Chemical cosmogony: The terrestrial planets	144
3.3.1	Urey and the formation of terrestrial planets	144
3.3.2	Ringwood's programme	147
3.3.3	High-temperature condensation	149
3.3.4	Inhomogeneous accumulation	153
3.3.5	Rejection of high-temperature condensation	154
3.4	Alfvén's electromagnetic programme	160
3.4.1	Methodology	160
3.4.2	Magnetic braking	161
3.4.3	Critical ionization velocity	162
3.4.4	The $\frac{2}{3}$ effect	163
3.4.5	The rings of Uranus	165
3.4.6	The rings of Jupiter	168

CONTENTS

vii

3.4.7 Jet streams	170
3.4.8 The evaluation of theories	170

PART 4 WHENCE THE MOON?

4.1 Introduction	177
4.1.1 Out of the Earth	177
4.1.2 Capture	179
4.1.3 Are the Earth and the Moon chemically similar?	181
4.1.4 <i>Apollo's</i> impact: All theories are refuted by the data	183
4.1.5 Giant impact is proposed	185
4.1.6 Giant impact is accepted	187
4.2 Early history of selenogony	189
4.2.1 Earth's Moon and planetary satellites	189
4.2.2 Secular acceleration	190
4.2.3 Darwin's fission theory	192
4.2.4 Alternatives to fission	195
4.3 Harold Urey and the origin of the Moon	199
4.3.1 Scientific rationale for lunar exploration	199
4.3.2 Revival of the capture theory	200
4.3.3 Revival of the fission theory	205
4.3.4 Siderophile abundance: A crucial test	209
4.3.5 Science and subjectivity	215
4.4 History of modern selenogony	218
4.4.1 The co-accretion theory	218
4.4.2 Evolution of the lunar orbit	220
4.4.3 First results from the lunar samples	223
4.4.4 The post- <i>Apollo</i> stalemate	233
4.4.5 The giant-impact hypothesis	241
4.4.6 Modifying the co-accretion theory	253
4.4.7 Conclusions?	258
<i>Abbreviations</i>	261
<i>Reference list and citation index</i>	265
<i>Index</i>	345
