[More information](#)

Over the past couple of decades there have been episodes of particularly rapid growth in output per head in a number of countries throughout the world, in particular in the UK since the early 1980s. To understand this phenomenon requires a detailed analysis of these productivity changes using data for individual firms. These changes in average performance for the economy as a whole can be related to changes in the spread between the productivity leaders and laggards. Drawing on research carried out under the leadership of the National Institute of Economic and Social Research in London, and with the help of the Fulbright Commission, the contributors to this volume provide a comparative analysis of data for a number of different countries. Chapters cover the UK, the USA, Canada, Japan, Australia, Belgium, Norway and Sweden, and comparisons also include Germany and the Netherlands. Using a variety of the most up-to-date methods of analysis, the contributors estimate the importance of a variety of different factors. Changes in competitive conditions, skills, innovation and the growth of small firms each have their part to play, as does the closure of the least productive establishments. The research in the UK was financed by the ESRC.

The National Institute of Economic and Social Research is an independent, non-profit-making body, founded in 1938. It has as its aim the promotion of realistic research, particularly in the field of economics. It conducts research by its own research staff and in cooperation with universities and other academic bodies.

### *Acknowledgements*

Melanie Lansbury and David Mayes gratefully acknowledge financial support from the Economic and Social Research Council, grant no. R000231195 for the research behind chapters 2, 3 and 4 and towards the costs of the colloquium. The participants also thank the Fulbright Commission and the British Academy whose grants made the meeting and the book possible. Richard Caves and Peter Hart have provided continuing advice and encouragement. The National Institute of Economic and Social Research hosted the colloquium.

2.1	Relative labour productivity (output per worker-hour)	<i>page</i> 21
2.2	Annual hours worked per employee in UK manufacturing industry	28
2.3	Real manufacturing productivity growth	32
2.4	Comparison of actual manufacturing productivity growth during the 1980s with that using 1980 employment shares as weights	39
2.5	Output growth 1990–92	41
2.6	Productivity growth in the upturn and downturn	43
2.7	Percentage contribution to growth of value added	44
2A.1	Definition of industries	46
2A.2	Manufacturing productivity (ratio of original estimates to published ACOP)	50
3.1	Distribution of productivity	54
3.2	Number of ‘births’ relative to the total number of businesses	56
3.3	Number of ‘deaths’ relative to the total number of businesses	57
3.4	Net new entrants as a percentage of the total number of firms in an industry, 1981–9 (UK manufacturing industry)	58
3.5	Cumulative net exits 1981–9 as a proportion of end of period businesses	58
3.6	Gross churning (entries + exits)/total businesses	60
3.7	Net churning (entries – exits)/total businesses	61
3.8	Percentage births/deaths above and below average productivity	62
3.9	Percentage growth of productivity, 1981–90	63
4.1	Summary statistics of average technical inefficiency	69
4.2	Correlation between measures of inefficiency	69

xiv	<b>List of tables</b>	
4.3	Comparison of inefficiency across five countries (ATI, 1977)	71
4.4	Rank correlation of average technical inefficiency between years	71
4.5	Average technical inefficiency in UK manufacturing industries	76
4.6	Explanations of inefficiency using ATI as the dependent variable. Static and lagged adjustment models	81
4.7	Dynamic explanations of inefficiency using first difference ATI (DATI) as the dependent variable fixed effects model	83
4.8	The influence of macroeconomic factors on ATI	84
6.1	Number of engineering plants visited by product area	99
6.2	Distribution of plant sizes in national samples of engineering plants	99
6.3	Medians and quartiles of population plant size distributions in the engineering industries, Britain and the Netherlands	99
6.4	Estimated productivity differentials for matched operations in national samples of engineering plants	103
6.5	Age distribution of machinery and shares of CNC machines in engineering plant samples	105
6.6	Qualifications and training in engineering plant samples	111
6.7	Vocational qualifications held by technical support staff in national samples	116
7.1	Regression estimates of hypotheses 1 to 3	132
7.2	Regression estimates of hypotheses 1 and 2 (base-trend unrestricted)	134
7A.1	Alternative measures of R&D costs, 1970–91	138
8.1	Growth rates of labour productivity	143
8.2	Labour productivity levels in Germany relative to the UK	146
8.3	Regression results: convergence	147
8.4	Growth of output and labour input	148
8.5	Median plant size, 1987	150
8.6	Correlation between labour productivity growth and median plant size	151
8.7	Productivity and fixed capital	152
8.8	Proportion of the workforce with certified qualifications	154
8.9	Labour productivity and labour force skills	156
8.10	Research and development expenditure	159
