

CONTENTS

<i>Preface</i>	ix
1 Basic definitions and examples	1
1.1 Groups: definition and examples	1
1.2 Homomorphisms: the relation between $SL(2, \mathbb{C})$ and the Lorentz group	6
1.3 The action of a group on a set	12
1.4 Conjugation and conjugacy classes	14
1.5 Applications to crystallography	16
1.6 The topology of $SU(2)$ and $SO(3)$	21
1.7 Morphisms	24
1.8 The classification of the finite subgroups of $SO(3)$	27
1.9 The classification of the finite subgroups of $O(3)$	33
1.10 The icosahedral group and the fullerenes	43
 2 Representation theory of finite groups	 48
2.1 Definitions, examples, irreducibility	48
2.2 Complete reducibility	52
2.3 Schur's lemma	55
2.4 Characters and their orthogonality relations	58
2.5 Action on function spaces	60
2.6 The regular representation	64
2.7 Character tables	69
2.8 The representations of the symmetric group	76
 3 Molecular vibrations and homogeneous vector bundles	 94
3.1 Small oscillations and group theory	94
3.2 Molecular displacements and vector bundles	97
3.3 Induced representations	104
3.4 Principal bundles	112

vi	<i>Contents</i>	
3.5	Tensor products	115
3.6	Representative operators and quantum mechanical selection rules	116
3.7	The semiclassical theory of radiation	129
3.8	Semidirect products and their representations	135
3.9	Wigner's classification of the irreducible representations of the Poincaré group	143
3.10	Parity	150
3.11	The Mackey theorems on induced representations, with applications to the symmetric group	161
3.12	Exchange forces and induced representations	168
	4 Compact groups and Lie groups	172
4.1	Haar measure	173
4.2	The Peter–Weyl theorem	177
4.3	The irreducible representations of $SU(2)$	181
4.4	The irreducible representations of $SO(3)$ and spherical harmonics	185
4.5	The hydrogen atom	190
4.6	The periodic table	198
4.7	The shell model of the nucleus	208
4.8	The Clebsch–Gordan coefficients and isospin	213
4.9	Relativistic wave equations	225
4.10	Lie algebras	234
4.11	Representations of $su(2)$	238
	5 The irreducible representations of $SU(n)$	246
5.1	The representation of $Gl(V)$ on the r -fold tensor product	246
5.2	$Gl(V)$ spans $\text{Hom}_{S_r}(T_r V, T_r V)$	248
5.3	Decomposition of $T_r V$ into irreducibles	250
5.4	Computational rules	252
5.5	Description of tensors belonging to W_λ	254
5.6	Representations of $Gl(V)$ and $Sl(V)$ on U_λ	258
5.7	Weight vectors	263
5.8	Determination of the irreducible finite-dimensional representations of $Sl(d, \mathbb{C})$	266
5.9	Strangeness	275
5.10	The eight-fold way	284
5.11	Quarks	288
5.12	Color and beyond	297
5.13	Where do we stand?	300

<i>Contents</i>	vii
Appendix A The Bravais lattices and the arithmetical crystal classes	309
A.1 The lattice basis and the primitive cell	309
A.2 The 14 Bravais lattices	311
Appendix B Tensor product	320
Appendix C Integral geometry and the representations of the symmetric group	327
C.1 Partition pairs	330
C.2 Proof of the main combinatorial lemma	338
C.3 The Littlewood–Richardson rule and Young’s rule	340
C.4 The ring of virtual representations of all the S_n	344
C.5 Dimension formulas	348
C.6 The Murnaghan–Nakayama rule	350
C.7 Characters of $GL(V)$	351
Appendix D Wigner’s theorem on quantum mechanical symmetries	354
Appendix E Compact groups, Haar measure, and the Peter–Weyl theorem	359
Appendix F A history of 19th century spectroscopy	382
Appendix G Characters and fixed point formulas for Lie groups	407
Further reading	424
Index	428
