	<i>Preface</i>	<i>page xv</i>
1	Introduction	1
	P. G. BRUCE	
1.1	A brief history of solid state electrochemistry	1
1.2	Crystalline electrolytes	4
1.3	Glass electrolytes	4
1.4	Polymer electrolytes	5
1.5	Intercalation electrodes	5
1.6	Interfaces	5
	References	6
2	Crystalline solid electrolytes I: General considerations and the major materials	7
	A. R. WEST	
2.1	Introduction	7
2.2	Conduction mechanisms	8
2.3	Mobile ion concentrations: doping effects	10
2.4	Materials with disordered sublattices: α -AgI	13
2.5	Ion trapping effects	15
2.6	Potential energy profiles	16
2.7	The activation energy for conduction	18
2.8	Hopping rates	18
2.9	The ac conductivity spectrum: local motions and long range conduction	20
2.10	Survey of solid electrolytes: general comments	23
2.11	The beta-aluminas	26
2.11.1	Stoichiometry	26
2.11.2	Structure	26
2.11.3	Properties	29
2.12	Other alkali ion conductors	31
2.12.1	NASICON	31
2.12.2	LISICON	33

Contents

2.12.3	Li ₄ SiO ₄ derivatives	34
2.12.4	Li ₃ N	36
2.12.5	Miscellaneous materials	37
2.13	Oxide ion conductors	38
2.14	Fluoride ion conductors	40
2.15	Proton conductors	40
	References	41
3	Crystalline solid electrolytes II: Material design	43
	J. B. GOODENOUGH	
3.1	Quality criteria	43
3.2	Electronic energies	45
3.3	Ionic energies	48
3.3.1	Intrinsic energy gap ΔH_g	48
3.3.2	Motional enthalpy ΔH_m	50
3.3.3	Trapping energy ΔH_t	52
3.4	Ionic conductivity	53
3.4.1	Phenomenology	53
3.4.2	Correlated ionic movements	56
3.4.3	Proton movements	57
3.5	Examples	59
3.5.1	Stoichiometric compounds	59
3.5.2	Doping strategies	63
3.5.3	Proton conductors	69
	References	72
4	Ionic transport in glassy electrolytes	74
	J. L. SOUQUET	
4.1	Ionic transport: experimental facts	74
4.2	Chemical composition of ionically conductive glasses	77
4.3	Kinetic and thermodynamic characteristics of glassy electrolytes	79
4.4	A microscopic approach to ionic transport in glasses	81
4.5	Thermodynamics of charge carriers: weak electrolyte theory	84
4.6	Conductivity measurements and the thermodynamics of glass	87
4.7	A microscopic model for ionic transport above the vitreous transition temperature	90
	References	93
5	Polymer electrolytes I: General principles	95
	D. F. SHRIVER AND P. G. BRUCE	
5.1	Background	95
5.2	Polymer-salt complexes	96
5.2.1	Early developments	96

Contents

5.2.2	Polymer segment motion and ion transport	97
5.2.3	Formation	100
5.2.4	Structure	104
5.2.5	Host polymers	106
5.2.6	Proton conductors	111
5.3	Polyelectrolytes	113
5.3.1	Influence of complexing agents and solvents	115
5.4	Summary	116
	References	117
6	Polymer electrolytes II: Physical principles	119
	P. G. BRUCE AND F. M. GRAY	
6.1	Introduction	119
6.2	Why do salts dissolve in polymers?	120
6.2.1	Thermodynamics of dissolution	120
6.2.2	Which salts dissolve in which polymers	122
6.2.3	Evidence for cation solvation	123
6.2.4	Ion association	124
6.2.5	Negative entropy of dissolution	127
6.3	Mechanisms of ionic conduction	128
6.3.1	Temperature and pressure dependence of ionic conductivity	129
6.3.2	The dynamic response of polymer electrolytes	139
6.4	Ion association and ion transport	143
6.4.1	Ion association	143
6.4.2	Transport	153
6.4.3	Summary	158
	Appendix	158
	References	160
7	Insertion electrodes I: Atomic and electronic structure of the hosts and their insertion compounds	163
	W. R. MCKINNON	
7.1	Important aspects of ionic and electronic structure	163
7.1.1	Sites for ions	164
7.1.2	'Sites' for electrons (electronic structure)	165
7.2	Examples of host compounds	169
7.2.1	One-dimensional host, three-dimensional network of sites	169
7.2.2	Three-dimensional structure, with one-dimensional tunnels	169
7.2.3	Two-dimensional systems: layered host, layers of sites for guests	170
7.2.4	Three-dimensional systems	172
7.3	Thermodynamics of insertion, ΔG , ΔS , ΔH	174
7.3.1	Relation of voltage to chemical potential	175
7.3.2	Measuring the partial entropy	178

Contents

7.4	Lattice-gas models	179
7.4.1	Entropy of ions	179
7.4.2	Entropy of electrons	180
7.4.3	$\text{Li}_x\text{Mo}_6\text{Se}_8$ as an example of a lattice gas	181
7.4.4	Site energies in lattice-gas models	183
7.4.5	Interaction energies in lattice-gas models	186
7.4.6	Role of disorder	189
7.4.7	Hysteresis	190
7.5	Microstructure – staging and cointercalation	191
7.5.1	Staging	191
7.5.2	Cointercalation	194
7.6	Future prospects	196
	References	196
8	Electrode performance	199
	W. WEPPNER	
8.1	Electrodes: Ionic sources and sinks	199
8.2	Transport of ions and electrons in mixed conductors	203
8.3	Kinetics of electrodes and the role of electrons in atomic transport	208
8.4	Thermodynamics of electrodes	216
8.5	Measurement of kinetic and thermodynamic electrode parameters	219
	References	228
9	Polymer electrodes	229
	B. SCROSATI	
9.1	Introduction	229
9.2	The case of polyacetylene	230
9.3	Electrochemical doping processes	234
9.4	Heterocyclic polymers	234
9.5	The electrochemical doping of heterocyclic polymers	237
9.6	Polyaniline	238
9.7	Mechanism of the doping processes in conducting polymers	240
9.8	Methods for monitoring the doping processes in conducting polymers	244
9.8.1	Optical adsorption	245
9.8.2	Microbalance studies	246
9.9	Kinetics of the electrochemical doping processes	247
9.9.1	Kinetics of polyacetylene electrodes	247
9.9.2	Kinetics of heterocyclic polymers	249
9.10	Methods for enhancing diffusion processes in polymer electrodes	254
9.11	Applications of polymer electrodes	255
9.12	Lithium rechargeable batteries	255
9.12.1	Charge–discharge rate	256

Contents

9.12.2	Self-discharge	257
9.12.3	Energy content	258
9.12.4	The future of the lithium/polymer battery	259
9.13	Optical displays	259
9.13.1	The future of polymer displays	261
	Acknowledgements	262
	References	262
10	Interfacial electrochemistry	264
	R. D. ARMSTRONG AND M. TODD	
10.1	The double layer at blocking interfaces	269
10.2	Non-blocking metal electrodes – one mobile charge in the electrolyte	277
10.3	Non-blocking metal electrodes with more than one mobile charge in the electrolyte	283
10.4	The effect of surface films on interfacial measurements	286
10.5	The effect of surface roughness on interfacial measurements	287
10.6	Other non-blocking interfaces	288
10.7	Two step charge transfer reactions	290
	References	291
11	Applications	292
	O. YAMAMOTO	
11.1	Introduction	292
11.2	Solid electrolyte batteries	293
11.3	Intercalation electrodes for batteries	311
11.4	Solid oxide fuel cells	314
11.5	Solid electrolyte sensors	321
11.6	Electrochromic devices (ECDs)	325
11.7	Electrochemical potential memory device	327
	References	329
