Preface	ix
List of symbols	xi
1 Approaching optimization by means of examples	1
1.1 Definition of optimization problem	1
1.2 Examples of optimization problems	3
2 An intuitive approach to mathematical programming	11
2.1 Introduction	11
2.2 Perturbation of the two problems	11
2.3 Introducing perturbations abstractly; bifunctions	15
2.4 Subdifferentiability	18
2.5 The Lagrangian	18
2.6 Duality	22
2.7 Perturbation of the dual problem	24
2.8 Global conditions versus local conditions	26
2.9 Mathematical programming versus dynamic programming	27
3 A global approach by bifunctions	30
3.1 Convexity and the positive cone	30
3.2 Topological considerations	33
3.3 Separation theorems	37
3.4 Two theorems on the positive cone	39
3.5 A geometric interpretation of inf and sup; normality	40
3.6 A duality theorem for convex bifunctional programming	44
3.7 Some sufficient conditions for normality	47
3.8 On the existence of optimal solutions	48
3.9 Summary of results; examples	54
3.10 Saddle-points, saddle-values and the meaning of the Lagrangian	56

vi	<i>Contents</i>
3.11 Lagrangian duality	59
3.12 Lagrangian duality; affine equality constraints	64
3.13 Lagrangian duality; mixed constraints; linear programming	66
3.14 Fenchel duality	71
3.15 Fenchel duality extended	79
3.16 On the equivalence of dualities	81
4 A global approach by conjugate duality	84
4.1 Converse duality; conjugate functions	84
4.2 Closed functions	90
4.3 Closed functions applied to normality and converse duality	94
4.4 The perturbation function and subdifferentiability	96
4.5 The Lagrangian	102
4.6 Saddle-points, variational inequalities and the complementarity problem	104
5 A local approach for optimization problems in Banach spaces	109
5.1 Introduction; Fréchet differentiability; some lemmas	109
5.2 Finitely many constraints; first-order conditions	113
5.3 Finitely many constraints; second-order conditions	119
5.4 Problems with arbitrary constraints; first-order conditions; linearizing sets	122
5.5 Problems with arbitrary constraints; second-order conditions	128
6 Some other approaches	131
6.1 The fixed point approach	131
6.2 The $\sup \inf = \inf \sup$ approach	142
6.3 Modified Lagrangians	146
7 Some applications	153
7.1 Returning to the initial examples; a well-known inequality	153
7.2 Chebyshev approximation	154
7.3 A fixed time optimal control problem	156
7.4 A two-period stochastic inventory problem	163

<i>Contents</i>	vii
7.5 Theorems of the alternative; multi-objective optimization	169
7.6 Relating dynamic programming to linear programming	173
7.7 Separation by optimization	175
Appendix A	176
Appendix B	177
Appendix C	181
Appendix D	182
Appendix E	184
Comments on the text and related literature	188
References	196
Index	202
