<i>Abstract</i>	xx
<i>Preface</i>	xxi
Introduction	1
1 Geocryology as part of planetary cryology	1
2 Frozen rocks as natural-historical geological formations	9
3 History of research of the zone of permafrost and the frozen materials composing this zone	18
4 Structure, problems and scientific themes of geocryology	26
5 Methodological basis of geocryology	31
I Thermal-physical, physico-chemical and mechanical processes in freezing, frozen and thawing ground and their manifestation in the permafrost regions.	
1 Thermal-physical processes in freezing and thawing ground	39
1.1 Heat transfer and temperature field in ground	39
1.2 Freezing (crystallization) of water and melting of ice in the ground	48
1.3 Sublimation and desublimation of moisture in frozen rocks	64
1.4 Freezing and thawing of ground	69
1.5 Methods for solving soil freezing (thawing) problems and approximate formulae for freezing and thawing depth calculations	83
2 Water transfer and ice formation in soils	93
2.1 Nature and mechanism of moisture migration in soils	93
2.2 Water transfer and ice formation in frozen soil	99

viii

Contents

2.3

Water transfer and ice formation in freezing and thawing soils

111

3

Physico-chemical and mechanical processes in freezing and thawing ground

120

3.1

Chemical reactions and processes in freezing and thawing soils

120

3.2

Physico-chemical and mechanical processes in freezing and thawing soils

126

3.3

Physical-mechanical processes in frozen soils caused by changes in temperature

139

3.4

Physical and chemical processes in frozen soils caused by an external load

144

4

Structure and texture of freezing and thawing soils

157

4.1

Thermal-physical and physical-mechanical conditions of development of migrational-segregated ice interlayers

157

4.2

Basic types of cryogenic structure

163

4.3

Formation of structure in freezing and thawing soils

172

4.4

Structural associations and types of contact in frozen soils

179

5

Cryogenic geological processes and phenomena

183

5.1

Classification of processes and phenomena

183

5.2

Frost heaving of soils

186

5.3

Frost cracking (fissuring) and polygonal formations, surface and underground

192

5.4

Thermokarst

197

5.5

Slope processes and phenomena

203

5.6

Processes and effects associated with the activity of water, glaciers and other geological agents

208

II

Composition, cryogenic structure and properties of frozen rocks

6

Formation of sedimentary materials in the permafrost regions (cryolithogenesis)

219

6.1

Sediment genesis in the permafrost regions

220

6.2

Transformation of loose deposits of the permafrost regions into rock

233

6.3

Formation of useful mineral deposits at different stages of cryogenesis

240

7

Composition and structure of frozen earth materials

247

7.1

Characteristics of organic, mineral and chemical composition of frozen earth materials

247

7.2

Unfrozen water and ice in ground

251

7.3

Textural characteristics of the frozen material

261

<i>Contents</i>	ix
7.4 Microstructure of frozen soils	270
8 Properties of frozen soils	276
8.1 Physical properties of the frozen materials	276
8.2 Thermal-physical properties of rocks	282
8.3 Moisture exchange properties of soils	289
8.4 Mechanical properties of frozen ground	292
9 Characteristics of the basic genetic types of frozen ground	304
9.1 Features of the cryogenic types of frozen strata	304
9.2 Composition and cryogenic structure of the principal geologic-genetic types of sedimentary materials in the permafrost regions	315
9.3 Natural ice as a monomineral rock	319
III Principles of the formation and development of the frozen strata and layers of seasonal freezing and thawing	
10 Thermodynamic and climatic conditions for formation of the frozen layers	331
10.1 Energy balance of the Earth	331
10.2 Thermodynamic conditions for development of seasonally and perennially frozen ground	336
10.3 Frozen ground as a result of zonation of thermal- and mass-exchange processes on the Earth's surface and in the atmosphere	340
11 Seasonal freezing and thawing of ground	346
11.1 Formation of the layer of seasonal freezing and thawing of soil	346
11.2 Types of seasonal freezing and thawing of the ground	352
11.3 The influence of landscape-climatic factors on the temperature regime and depth of seasonal freezing and thawing of the ground	359
12 Development of the temperature regime and the thickness of the permafrost	373
12.1 Present-day knowledge of the development of permafrost	373
12.2 The effect of boundary conditions on the permafrost thickness and temperature regime	377
12.3 Dependence of the permafrost thickness and temperature regime on geological factors and processes	383
13 Taliks and groundwater in the permafrost zone	388
13.1 The types and formation of taliks in the permafrost zone	388

x	<i>Contents</i>	
13.2	Groundwater of the permafrost regions	394
13.3	Interaction of groundwater with the permafrost and types of cryohydrogeological structures	400
IV	Regional features and evolution of permafrost	
14	Permafrost evolution in the Earth's history	409
14.1	History of the development of permafrost and its distribution on the planet	409
14.2	Reasons for the development and evolution of permafrost in the Earth's history	418
14.3	The history of geocryological development and the main stages of permafrost formation on the territory of the former USSR in the Late Cenozoic	422
15	Zonal and regional features of present-day geocryological conditions in the territories of the former USSR	435
15.1	Distribution of permafrost and spatial variations of its mean annual temperature	435
15.2	Structure of the permafrost and spatial variability of its thickness	445
15.3	Distribution of main types of seasonal ground thawing and freezing	459
16	Principles and methods for regional geocryological investigations	464
16.1	Geocryological survey as the basis for regional investigation of the seasonally and perennially freezing zones	464
16.2	The methods and carrying-out of geocryological surveys	472
16.3	Classification and regionalization in the course of geocryological survey	478
16.4	Regionalization in geocryological mapping	482
V	Rational use of frozen ground and environmental protection in the course of economic development of the permafrost regions	
17	The effect of different types of development on the natural geocryological environment	495
17.1	The basic principles of rational use of frozen ground in the course of the economic development of the permafrost regions	495
17.2	Regional environmental change in the course of development of extensive areas within the permafrost zone	503
17.3	Economic development of the permafrost regions with various kinds of construction	505

<i>Contents</i>	xi
17.4 Development in the permafrost regions for the mining industry and underground engineering	515
17.5 Types of agrobiological development in the permafrost regions	520
18 Ensuring the stability of engineering structures in the permafrost regions	525
18.1 Principles of construction on permafrost (bases and foundations)	525
18.2 Methods of amelioration of frozen ground for foundations	534
18.3 Principles of foundation design and selection of type of foundation for construction on permafrost	540
18.4 Normative documents for engineering design and construction in the permafrost regions	546
19 Engineering geology in support of design, construction and operation of structures in the permafrost regions	550
19.1 Engineering-geological survey in the permafrost regions	550
19.2 Forecasting change in the geocryological conditions in the course of development	554
19.3 Principles and methods of the control of cryogenic processes	562
19.4 The basis of the rational use and protection of the geological environment in the permafrost regions	569
