|-----------------------------------------------------------------|-----------|
| <i>Preface</i>                                                  | page xi   |
| <i>Introduction for game theorists</i>                          | xiv       |
| <i>Introduction for biologists</i>                              | xx        |
| <i>About this book</i>                                          | xxvi      |
| <b>Part one: Dynamical Systems and Lotka–Volterra Equations</b> | <b>1</b>  |
| <b>1 Logistic growth</b>                                        | <b>3</b>  |
| 1.1 Population dynamics and density dependence                  | 3         |
| 1.2 Exponential growth                                          | 4         |
| 1.3 Logistic growth                                             | 5         |
| 1.4 The recurrence relation $x' = Rx(1 - x)$                    | 5         |
| 1.5 Stable and unstable fixed points                            | 6         |
| 1.6 Bifurcations                                                | 7         |
| 1.7 Chaotic motion                                              | 9         |
| 1.8 Notes                                                       | 10        |
| <b>2 Lotka–Volterra equations for predator–prey systems</b>     | <b>11</b> |
| 2.1 A predator–prey equation                                    | 11        |
| 2.2 Solutions of differential equations                         | 12        |
| 2.3 Analysis of the Lotka–Volterra predator–prey equation       | 13        |
| 2.4 Volterra’s principle                                        | 15        |
| 2.5 The predator–prey equation with intraspecific competition   | 16        |
| 2.6 On $\omega$ -limits and Lyapunov functions                  | 18        |
| 2.7 Coexistence of predators and prey                           | 19        |
| 2.8 Notes                                                       | 21        |
| <b>3 The Lotka–Volterra equations for two competing species</b> | <b>22</b> |
| 3.1 Linear differential equations                               | 22        |
| 3.2 Linearization                                               | 24        |

|          |                                                               |    |
|----------|---------------------------------------------------------------|----|
| vi       | <i>Contents</i>                                               |    |
| 3.3      | A competition equation                                        | 26 |
| 3.4      | Cooperative systems                                           | 28 |
| 3.5      | Notes                                                         | 30 |
| <b>4</b> | <b>Ecological equations for two species</b>                   | 31 |
| 4.1      | The Poincaré–Bendixson theorem                                | 31 |
| 4.2      | Periodic orbits for two-dimensional Lotka–Volterra equations  | 33 |
| 4.3      | Limit cycles and the predator–prey model of Gause             | 34 |
| 4.4      | Saturated response                                            | 37 |
| 4.5      | Hopf bifurcations                                             | 38 |
| 4.6      | Notes                                                         | 40 |
| <b>5</b> | <b>Lotka–Volterra equations for more than two populations</b> | 42 |
| 5.1      | The general Lotka–Volterra equation                           | 42 |
| 5.2      | Interior rest points                                          | 43 |
| 5.3      | The Lotka–Volterra equations for food chains                  | 45 |
| 5.4      | The exclusion principle                                       | 47 |
| 5.5      | A model for cyclic competition                                | 48 |
| 5.6      | Notes                                                         | 53 |
|          | <b>Part two: Game Dynamics and Replicator Equations</b>       | 55 |
| <b>6</b> | <b>Evolutionarily stable strategies</b>                       | 57 |
| 6.1      | Hawks and doves                                               | 57 |
| 6.2      | Evolutionary stability                                        | 59 |
| 6.3      | Normal form games                                             | 61 |
| 6.4      | Evolutionarily stable strategies                              | 62 |
| 6.5      | Population games                                              | 65 |
| 6.6      | Notes                                                         | 66 |
| <b>7</b> | <b>Replicator dynamics</b>                                    | 67 |
| 7.1      | The replicator equation                                       | 67 |
| 7.2      | Nash equilibria and evolutionarily stable states              | 69 |
| 7.3      | Strong stability                                              | 72 |
| 7.4      | Examples of replicator dynamics                               | 74 |
| 7.5      | Replicator dynamics and the Lotka–Volterra equation           | 77 |
| 7.6      | Time averages and an exclusion principle                      | 78 |
| 7.7      | The rock–scissors–paper game                                  | 79 |
| 7.8      | Partnership games and gradients                               | 82 |
| 7.9      | Notes                                                         | 85 |
| <b>8</b> | <b>Other game dynamics</b>                                    | 86 |
| 8.1      | Imitation dynamics                                            | 86 |

| <i>Contents</i>                                          | <i>vii</i> |
|----------------------------------------------------------|------------|
| 8.2 Monotone selection dynamics                          | 88         |
| 8.3 Selection against iteratively dominated strategies   | 90         |
| 8.4 Best-response dynamics                               | 93         |
| 8.5 Adjustment dynamics                                  | 97         |
| 8.6 A universally cycling game                           | 98         |
| 8.7 Notes                                                | 100        |
| <b>9 Adaptive dynamics</b>                               | 101        |
| 9.1 The repeated Prisoner's Dilemma                      | 101        |
| 9.2 Stochastic strategies for the Prisoner's Dilemma     | 103        |
| 9.3 Adaptive Dynamics for the Prisoner's Dilemma         | 104        |
| 9.4 An ESS may be unattainable                           | 107        |
| 9.5 A closer look at adaptive dynamics                   | 108        |
| 9.6 Adaptive dynamics and gradients                      | 109        |
| 9.7 Notes                                                | 112        |
| <b>10 Asymmetric games</b>                               | 113        |
| 10.1 Bimatrix games                                      | 113        |
| 10.2 The Battle of the Sexes                             | 114        |
| 10.3 A differential equation for asymmetric games        | 116        |
| 10.4 The case of two players and two strategies          | 119        |
| 10.5 Role games                                          | 122        |
| 10.6 Notes                                               | 125        |
| <b>11 More on bimatrix games</b>                         | 126        |
| 11.1 Dynamics for bimatrix games                         | 126        |
| 11.2 Partnership games and zero-sum games                | 127        |
| 11.3 Conservation of volume                              | 132        |
| 11.4 Nash–Pareto pairs                                   | 135        |
| 11.5 Game dynamics and Nash–Pareto pairs                 | 137        |
| 11.6 Notes                                               | 139        |
| <b>Part three: Permanence and Stability</b>              | 141        |
| <b>12 Catalytic hypercycles</b>                          | 143        |
| 12.1 The hypercycle equation                             | 143        |
| 12.2 Permanence                                          | 145        |
| 12.3 The permanence of the hypercycle                    | 149        |
| 12.4 The competition of disjoint hypercycles             | 151        |
| 12.5 Notes                                               | 152        |
| <b>13 Criteria for permanence</b>                        | 153        |
| 13.1 Permanence and persistence for replicator equations | 153        |

|           |                                                                       |     |

| <b>18 Discrete dynamical systems in population genetics</b> | <b>235</b> |
| 18.1 Genotypes                                              | 235        |
| 18.2 The Hardy–Weinberg law                                 | 236        |
| 18.3 The selection model                                    | 237        |
| 18.4 The increase in average fitness                        | 238        |
| 18.5 The case of two alleles                                | 240        |
| 18.6 The mutation–selection equation                        | 241        |
| 18.7 The selection–recombination equation                   | 243        |
| 18.8 Linkage                                                | 245        |
| 18.9 Fitness under recombination                            | 247        |
| 18.10 Notes                                                 | 248        |
| <b>19 Continuous selection dynamics</b>                     | <b>249</b> |
| 19.1 The selection equation                                 | 249        |
| 19.2 Convergence to a rest point                            | 251        |
| 19.3 The location of stable rest points                     | 254        |
| 19.4 Density dependent fitness                              | 256        |
| 19.5 The Shahshahani gradient                               | 257        |
| 19.6 Mixed strategists and gradient systems                 | 261        |
| 19.7 Notes                                                  | 264        |
| <b>20 Mutation and recombination</b>                        | <b>265</b> |
| 20.1 The selection–mutation model                           | 265        |
| 20.2 Mutation and additive selection                        | 266        |
| 20.3 Special mutation rates                                 | 268        |
| 20.4 Limit cycles for the selection–mutation equation       | 270        |
| 20.5 Selection at two loci                                  | 273        |
| 20.6 Notes                                                  | 277        |
| <b>21 Fertility selection</b>                               | <b>278</b> |
| 21.1 The fertility equation                                 | 278        |
| 21.2 Two alleles                                            | 280        |
| 21.3 Multiplicative fertility                               | 282        |
| 21.4 Additive fertility                                     | 285        |
| 21.5 The fertility–mortality equation                       | 286        |
| 21.6 Notes                                                  | 288        |
| <b>22 Game dynamics for Mendelian populations</b>           | <b>289</b> |
| 22.1 Strategy and genetics                                  | 289        |
| 22.2 The discrete model for two strategies                  | 292        |
| 22.3 Genetics and ESS                                       | 295        |
