## Genetics and Criminal Behavior

In this volume, a group of distinguished philosophers address basic conceptual, methodological, and ethical issues raised by genetic research on criminal behavior. Their contributions fill a large gap between popular accounts of “crime genes” and technical discussions of heritability, linkage, and genetic variation. They explain the scientific debate about behavioral genetics in lucid but precise terms, and place it in the context of broader issues about causation, moral responsibility, and political justice. The book will be of great value to philosophers, legal scholars, scientists, and policy makers interested in the potential of genetic research to predict, understand, and modify human behavior, and to educated laymen curious or perplexed about the recent controversies surrounding behavioral genetics.

David Wasserman and Robert Wachbroit are both research scholars at the Institute for Philosophy and Public Policy at the University of Maryland.

## Acknowledgments

This anthology arose out of a project on behavioral genetics and crime, funded by a grant from the Ethical, Legal, and Social Implications (ELSI) Branch of the National Institute for Human Genome Research (R13 HG00703). As it turned out, our proposed discussion of genetic research and criminal behavior proved to be as controversial as the research itself. We wish to thank the many friends, colleagues, and scholars who supported us in the face of this controversy. We are particularly grateful to Eric Juengst, ELSI branch chief at the time the project was funded, Jacob Goldhaber, acting provost of the University of Maryland, College Park, and Victor Medina, then the University's director of sponsored programs.

The contributions to the anthology were the product of two working groups that examined the meaning and significance of research claiming to find genetic influences on criminal behavior. One group focused on the interpretation and plausibility of claims of genetic influence, the other on the relevance of those claims to the assignment of moral and legal responsibility. We are indebted to several present and former colleagues at the Institute for Philosophy and Public Policy for their work on these groups. Alan Strudler helped recruit and direct the group on genetic influence and responsibility. Teresa Chandler provided skillful assistance both in conducting the working group meetings and in preparing summaries of the discussion for the authors. Carroll Linkins handled the arrangements for the meetings with great efficiency and finesse.
