The Physics of Particle Detectors

This text provides a comprehensive introduction to the physical principles and design of particle detectors, covering all major detector types in use today. The book begins with a reprise of the size and energy scales involved in different physical processes. It then considers non-destructive methods, including the photoelectric effect, photomultipliers, scintillators, Cerenkov and transition radiation, scattering and ionization and the use of magnetic fields in drift and wire chambers. A complete chapter is devoted to silicon detectors. In the final part of the book, the author discusses destructive measurement techniques including Thomson and Compton scattering, Bremsstrahlung and calorimetry. Throughout the book, emphasis is placed on explaining the physical principles on which detection is based, and showing, by considering appropriate examples, how those principles are best utilized in real detectors. This approach also reveals the limitations that are intrinsic to different devices.

DAN GREEN received his Ph.D. from the University of Rochester in 1969. He was a post-doc at Stony Brook from 1969 to 1972 and worked at the Intersecting Storage Rings (ISR) at CERN. His next appointment was as an Assistant Professor at Carnegie Mellon University from 1972 to 1978 during which time he was also Spokesperson of a BNL Baryonium Experiment. He has been a Staff Scientist at Fermilab from 1979 to the present, and has worked in a wide variety of roles on experiments both at Fermilab and elsewhere. He worked on the D0 Experiment as Muon Group Leader from 1982 to 1990 and as B Physics Group Co-Convener from 1990 to 1994. He led the US Compact Muon Solenoid (CMS) Collaboration as Spokesperson for the US groups working at the Large Hadron Collider (LHC) at CERN. At Fermilab, he was Physics Department Deputy Head from 1984 to 1986 and Head from 1986 to 1990. From 1993 to present he has served as the CMS Department Head in the Particle Physics Division.

Acknowledgments

This book represents a distillation of 30 years of experimental experience. The author cannot possibly individually acknowledge all the colleagues who ‘taught him the business’ of experimental high energy physics. Suffice it to say that he is indebted to a multitude. The input of the students who were subjected to lectures consisting of parts of this text was often incisive and thought provoking. The enthusiasm and dedication of Ms. Terry Grozis in assembling the final document from inaudible tapes, scraps of paper and marginal digressions were also of inestimable value. Dr. John Womersley and Dr. Adam Para are thanked for a critical reading of the text and for valuable suggestions. Finally, the students subjected to a full course of lectures in the summer of 1997 gave very valuable criticism.
