Mountain Weather and Climate Third Edition

Mountains and high plateau areas account for a quarter of the Earth's land surface. They give rise to a wide range of meteorological phenomena and distinctive climatic characteristics of consequence for ecology, forestry, glaciology and hydrology. *Mountain Weather and Climate* remains the only comprehensive text describing and explaining mountain weather and climate processes. It presents the results of a broad range of studies drawn from across the world.

Following an introductory survey of the historical aspects of mountain meteorology, three chapters deal with the latitudinal, altitudinal and topographic controls of meteorological elements in mountains, circulation systems related to orography, and the climatic characteristics of mountains. The author supplies regional case studies of selected mountain climates from New Guinea to the Yukon, a chapter on bioclimatology that examines human bioclimatology, weather hazards and air pollution, and a concluding chapter on the evidence for and the significance of changes in mountain climates.

Since the first edition of this book appeared over two decades ago several important field programs have been conducted in mountain areas. Notable among these have been the European Alpine Experiment and related investigations of local winds, studies of air drainage in complex terrain in the western United States and field laboratory experiments on air flow over low hills. Results from these investigations and other research are incorporated in this new edition and all relevant new literature is referenced.

ROGER G. BARRY is Distinguished Professor of Geography at the University of Colorado and Director, World Data Center for Glaciology and the National Snow and Ice Data Center, Boulder.

FIGURES

1.1	Latitudinal cross-section of the highest summits, highest and lowest snow lines, and highest and lowest upper limits of timberline (from Barry and Ives, 1974).	page 3
1.2	Alpine and highland zones and their climatic characteristics (after N. Crutzbberg, from Ives and Barry, 1974).	5
1.3	The Sonnblick Observatory in April 1985 (R. Boehm).	7
1.4	The mountain atmosphere (after Ekhart, 1948).	12
1.5	Scales of climatic zonation in mountainous terrain (after Yoshino, 1975).	13
1.6	Automatic weather station in the Andes (D. Hardy).	15
2.1	(a) and (b) Daily Sun paths at latitudes 60° N and 30° N (from <i>Smithsonian Meteorological Tables</i> , 6 th edn).	25
2.2	Thermoisopleth diagrams of mean hourly temperatures (°C) at (a) Pangrango, Java, 7° S, 3022 m (after Troll, 1964) and (b) Zugspitze, Germany, 47° N, 2962 m (after Hauer, 1950).	27
2.3	Mean daily temperature range versus latitude for a number of high valley and summit stations (after Lauscher, 1966).	28
2.4	Examples of the relations with altitude of hygric continentality, winter snow cover duration and thermal continentality, and tree species in Austria (after Aulitsky <i>et al.</i> , 1982).	31
2.5	Annual averages and range of monthly means of absolute humidity (g m^{-3}) as a function of altitude in tropical South America (after Prohaska, 1970).	34
2.6	Profiles of zenith-path transmissivity for a clean, dry atmosphere with ozone, a clean, wet atmosphere and a dirty, wet atmosphere; profiles of the theoretical transmissivity index (K) of W. P. Lowry are also shown for $K = 1, 2,$ and 4 (after Lowry, 1980b).	37
2.7	Direct solar radiation versus altitude in an ideal atmosphere for $m = 1$ (after Kastrov, in Kondratyev, 1969; p. 262) and as observed at mountain stations (based on Abetti, 1957; Kimball, 1927; Pope 1977).	39
2.8	Altitudinal variation of seasonal mean values ($\text{W m}^{-2} \text{km}^{-1}$), of (a) all-sky shortwave radiation; (b) upward longwave (infrared) radiation; and (c) downward longwave radiation measured at ASRB stations in the Swiss Alps (adapted from Marty <i>et al.</i> , 2002).	41
2.9	Global solar radiation versus cloud amount at different elevations in the Austrian Alps in June and December (based on Sauberer and Dirmhirn, 1958).	43

LIST OF FIGURES	viii
2.10 Diffuse (sky) radiation versus cloud amount in winter and summer at different elevations in the Alps (from Sauberer and Dirmhirn, 1958).	44
2.11 Curvilinear relationships between the cloud modification factor (CMF) and UV radiation reported by different sources (from Calbo <i>et al.</i> , 2005).	47
2.12 Altitudinal variation of seasonal and annual mean values of all-sky net radiation (R_n , $\text{W m}^{-2} \text{ km}^{-1}$) measured at ASRB stations in the Swiss Alps (adapted from Marty <i>et al.</i> , 2002).	50
2.13 The ratio of net radiation (R_n) to solar radiation (S) versus height in the Caucasus in summer (after Voloshina, 1966).	51
2.14 Lapse rates of minimum, mean and maximum temperatures in the Alps (after Rolland, 2003).	54
2.15 Schematic vertical temperature profiles on a clear winter night for three topographic situations: (a) isolated mountain; (b) limited plateau; (c) extensive plateau; and a generalized model of the effects of local and large-scale mountain topography on the depth of the seasonally-modified atmosphere (after Tabony, 1985).	55
2.16 The annual variation of altitudinal gradients of air temperature and 30 cm soil temperature between two upland stations in the Pennines and the lowland station of Newton Rigg (from Green and Harding, 1979).	56
2.17 Differences between altitudinal gradients of soil and air temperature at pairs of stations in Europe (from Green and Harding, 1980).	58
2.18 Mean daily temperature range versus altitude in different mountain and highland areas: I, Alps; II, western USA; III, eastern Africa; IV, Himalya; V, Ethiopian highlands (after Lauscher, 1966).	59
2.19 Mean daily temperatures in the free air and at mountain stations in the Alps (after Hauer, 1950).	62
2.20 Mean summit-free air temperature differences (K) in the Alps as a function of time and wind speed (after Richner and Phillips, 1984).	63
2.21 Mean summit-free air temperature differences in the Alps as a function of cloud cover (eighths) for 00 and 12 UT (after Richner and Phillips, 1984).	63
2.22 Components of the mean daily thermal circulation (cm s^{-1}) above Tibet (from Flohn, 1974).	66
2.23 Plots of the temperature structure above plateau surfaces at 900, 700 and 500 mb, plotted as differences between the temperatures calculated above elevated and sea-level surfaces for four values of Bowen ratio, β (from Molnar and Emanuel, 1999).	67
2.24 Schematic illustration of the effects on surface and boundary layer temperatures of lowland and high plateau surfaces and three different atmospheric conditions: (a) dry, transparent atmosphere; (b) warm, moist, semi-opaque atmosphere; (c) hot, moist opaque atmosphere (from Molnar and Emanuel, 1999).	68
2.25 Schematic isentropes on slopes during surface heating and radiative cooling (after Cramer and Lynott, 1961).	69

LIST OF FIGURES	ix
2.26 Wind speeds observed on mountain summits (V_m) in Europe and at the same level in the free air (V_f) (from Wahl, 1966).	73
2.27 Schematic illustration of streamlines over a hill showing phase tilt upwind (dashed line) (from Smith, 1990).	76
2.28 Schematic illustration of a “dividing streamline” in stably-stratified airflow encountering a hill (modified after Etling, 1989).	76
2.29 Generalized flow behavior over a hill for various stability conditions (after Stull, 1988).	78
2.30 Schematic illustration of the forcing and response of airflow along (above) and across (below) a heated barrier (from Crook and Turner, 2005).	79
2.31 Schematic illustration of the speed-up of boundary layer winds (ΔU) over a low hill and the corresponding pattern of pressure anomalies (modified after Taylor <i>et al.</i> , 1987; Hunt and Simpson, 1982).	82
2.32 Examples of flow separation: (a) separation at a cliff top (S), joining at J. A “bolster” eddy resulting from flow divergence is shown at the base of the steep windward slope; (b) separation on a lee slope with a valley eddy. The upper flow is unaffected; (c) separation with a small lee slope eddy. A deep valley may cause the air to sink resulting in cloud dissipation above it (from Scorer, 1978).	85
2.33 Average direct beam solar radiation (W m^{-2}) incident at the surface under cloudless skies at Trier, West Germany and Tucson, Arizona, as a function of slope, aspect, time of day and season of year (from Barry and Chorley, 1987, after Geiger, 1965 and Sellers, 1965).	88
2.34 Relative radiation on north- and south-facing slopes, at latitude 30° N for daily totals of extra-terrestrial direct beam radiation on 21 June (after Lee, 1978).	88
2.35 Annual totals of possible direct solar radiation according to latitude for 10° and 30° north- and south-facing slopes, in percentages relative to those for a horizontal surface (from Kondratyev and Federova, 1977).	89
2.36 Computed global solar radiation for cloudless skies, assuming a transmission coefficient of 0.75, between 0600 and 1000 h on 23 September for Mt. Wilhelm (Δ = summit) area of Papua New Guinea (from Barry, 1978).	93
2.37 Components of solar and infrared radiation incident on slopes.	95
2.38 Relations between monthly soil temperatures (0–1 cm) and air temperature (2 m) near the forest limit, Obergürl, Austria (2072 m), June 1954–July 1955 (Aulitsky, 1962, from Yoshino, 1975).	98
2.39 A “flagged” Engelmann spruce tree in the alpine forest–tundra ecotone, Niwot Ridge, Colorado. Growth occurs only on the downward side of the stem.	99
2.40 Schematic relationships between terrain, microclimate, snow cover and tree growth at the tree line (2170 m) near Davos, Switzerland (after Turner <i>et al.</i> , 1975).	101
2.41 Direct and diffuse solar radiation measured on 30° slopes facing north-northwest and south-southwest at Hohenpeissenberg, Bavaria (after Grunow, 1952).	103

LIST OF FIGURES	x
2.42 Differences in monthly mean ground temperatures, south slope minus north slope, May 1950–September 1951 at Hohenpeissenberg, Bavaria. Daily means (a) means at 1400 h (b) (after Grunow, 1952).	103
2.43 Daily mean maximum and minimum soil temperatures to 35 cm depth on sunny and shaded slopes near the tree line, Davos (2170 m) in January and July 1968–70 (after Turner <i>et al.</i> , 1975).	108
3.1 Schematic vertical section illustrating the response of the atmosphere to westerly flow over a mountain range. (a) and (b) are barotropic atmospheres; the clockwise (counterclockwise) arrows indicate the generation of anticyclonic (cyclonic) vorticity for a northern hemisphere case. (c) and (d) are baroclinic atmospheres (from Hoskins and Karoly, 1981).	127
3.2 The representation of northern hemisphere topography in one-degree resolution data and in spectral models with triangular truncation at T42 and T63 (from Hoskins, 1980).	130
3.3 Flow patterns in plan view showing the effect of a three-dimensional ridge: (a) for F^{-1} large and a ridge length $L_r < S$; (b) the point of flow splitting is close to the ridge ($S \ll L_r$) and a barrier jet forms; (c) cross-section view from the south, corresponding to (a) showing lower flow splitting around the barrier and upper flow passing over it; (d) cross-section view corresponding to (b) showing isentropic surfaces that approximate flow lines. (a) based on Pierrehumbert and Wyman (1985); (c) and (d) on Shutts (1998).	133
3.4 Schematic illustration of barrier winds north of the Brooks range, Alaska, where northerly upslope flow is deflected to give westerly components at levels near the mountains: (a) vertical cross-section of stable air flowing towards the Brooks Range; (b) plan view of the wind vector (after Schwerdtfeger, 1975a).	135
3.5 Cold air damming east of the Appalachian Mountain, USA, looking north. There is a sloping inversion above the cold air dome, a cold northeasterly low level jet (LLJ), easterly warm advection over the cold dome, and a southwesterly flow aloft (adapted from Bell and Bosart, 1988).	136
3.6 “Corner effect” on airflow east of the Massif Central (the Mistral), east of the Pyrenees (the Tramontane), and east of the Cantabrian Mountains of Spain (partly after Cruette, 1976).	137
3.7 An example of a streamline analysis for the Alps, omitting areas exceeding 750 m altitude, 24 June 1978 (from Steinacker, 1981).	139
3.8 The effects of mountain barriers on frontal passages: (a) warm front advance; (b) windward retardation; (c) separation.	140
3.9 Schematic picture of a cold front propagating across a mountain ridge. The isolines depict potential vorticity (after Dickinson and Knight, 2004).	141
3.10 Isochrones showing the passage of a cold front over the Alps, 0000 GMT 23 June to 1200 GMT 25 June 1978 (from Steinacker, 1981).	142

LIST OF FIGURES	xi
3.11 The density of cyclogenesis (per 10^6 km^2 per month) in the northern hemisphere analyzed from ECMWF ERA-15 reanalysis data, updated with operational analyses, for December–February, 1979–2000 (from Hoskins and Hodges, 2002).	143
3.12 Cyclonic eddies forming in westerly flow over a model Alpine/Pyrenean topography (D. J. Boyer and <i>Met. Atmos. Physics</i> 1987, Springer).	145
3.13 Lee cyclogenesis associated with a frontal passage over the Alps. (a) Surface pressure map, 3 April 1973, 0000 GMT; (b) Cross-section along the line C–D of (a). Isentropes (K) and isotachs (knots); (c) As (a) for 1200 GMT; (d) As (b) for 1200 GMT along the line E–F (from Buzzi and Tibaldi, 1978).	146
3.14 Types of airflow over a mountain barrier in relation to the vertical profile of wind speed. (a) Laminar streaming; (b) Standing eddy streaming; (c) Wave streaming, with a crest cloud and downwind rotor clouds; (d) Rotor streaming (from Corby, 1954).	151
3.15 Lee wave clouds – a pile of plates, Sangre da Cristo, Colorado (E. McKim).	152
3.16 Lee wave clouds in the San Luis valley, Colorado (G. Kiladis).	152
3.17 The distribution of velocity, pressure and buoyancy perturbations in an internal gravity wave in the $x-z$ plane (from Durran, 1990).	154
3.18 Calculated streamlines showing wave development over a ridge for two idealized profiles of wind speed (u) and potential temperature (θ) (from Sawyer, 1960).	156
3.19 Schematic illustrations of water flow over an obstacle in a channel. (a) Absolutely subcritical flow; (b) partially blocked flow with a bore progressing upstream at velocity c and a hydraulic jump in the lee; (c) totally blocked flow; (d) absolutely supercritical flow (from Long, 1969).	159
3.20 Lee waves developed in simulated northwesterly flow over a model Alpine/Pyrenean topography. (D. J. Boyer and <i>Met. Atmos. Physics</i> 1987, Springer).	160
3.21 Streamlines for 16 February 1952 in the lee of the Sierra Nevada, based on glider measurements, showing a large rotor and lenticular wave cloud (adapted from Holmboe and Klieforth, 1957).	162
3.22 Lee wave locations in relation to wind direction in the French Alps (after Gerbier and Bérenger, 1961).	163
3.23 Vortex street downstream of the Cape Verde Islands, 5 January 2005, as seen in MODIS bands 1, 3 and 4 (NASA-GSFC).	164
3.24 Schematic illustration of a von Karman vortex in the lee of a cylindrical obstacle (after Chopra, 1973).	165
3.25 Wakes in the lee of the Windward Islands of the Lesser Antilles (NASA Visible Earth).	166
3.26 Laboratory model of double eddy formation in the lee of a cylindrical obstacle for easterly flow in a rotating water tank. (D. J. Boyer and the Royal Society, London <i>Phil. Trans.</i> 1982, plate 6, pp. 542).	167

LIST OF FIGURES	xii
3.27 Cirriform clouds at 8.5 km over the Himalaya (K. Steffen).	168
3.28 Adiabatic temperature changes associated with different mechanisms of föhn descent. (a) Blocking of low-level air to windward slope, with adiabatic heating on the lee (from Beran, 1967). (b) Ascent partially in cloud on windward slope, giving cooling at SALR with descending air on lee slope warming at the DALR.	171
3.29 Three types of föhn. (a) Cyclonic föhn in a stable atmosphere with strong winds; (b) cyclonic föhn in a less stable atmosphere; and (c) anticyclonic föhn with a damming up of cold air (after Cadez, 1967; from Yoshino, 1975).	172
3.30 Composite soundings for times of windstorms in Boulder, Colorado. (a) Upwind sounding (west of the Continental Divide). (b) Downwind soundings (Denver) for storms in Boulder or on the slopes just to the west (from Brinkmann, 1974a).	180
3.31 A cross-section of potential temperature K based on aircraft data during a windstorm in Boulder on 11 January 1972. The dashed line separates data collected at different times. The three bands of turbulence above Boulder were recorded along horizontal flight paths and are probably continuous vertically (after Lilly, 1978).	181
3.32 Sketch of the forces involved in anabatic (left) and katabatic (right) slope winds. The temperature of the air in columns A and B determines their density (ρ).	187
3.33 Pilot balloon observations (B) and theoretical (T) slope winds on the Nordkette, Innsbruck: (a) upslope; (b) downslope (from Defant, 1949).	188
3.34 Drainage wind velocity (v) on an 11.5° slope as a function of time, for different values of lapse rate (γ) and friction coefficient (k) (from Petkovšek and Hočevár, 1971).	193
3.35 Pressure anomalies (schematic) in relation to the mountain and valley wind system at 6-h intervals along the Gudbrandsdalen, Norway (after Sterten and Knudsen, 1961).	197
3.36 Depth–width and shape relationships in idealized valley cross-sections for a valley without and with a horizontal floor. See text (Müller and Whiteman, 1988).	199
3.37 Sections of wind vectors and potential temperature, respectively, (a) and (c) cross-valley and (b) and (d) along-valley, for a WRF model simulation with three-dimensional plains–valley topography. The cross-sections are 20 km upvalley (from Rampanelli <i>et al.</i> , 2004).	200
3.38 Mountain and valley winds in the vicinity of Mt. Rainier, Washington. (a) Longitudinal section in the upper Carbon River Valley, 8–10 August 1960; (b) cross-section in the same valley, 9 July 1959 (from Buettner and Thyer, 1966).	201
3.39 An idealized view of the typical diurnal evolution of temperature (bold) and wind structure in a 500-m-deep valley in western Colorado (from Whiteman, 1990).	203

LIST OF FIGURES

xiii

- 3.40 Model of mountain and valley wind system in the Dischma Valley, Switzerland. (a) Midnight to sunrise on the east-facing slope; (b) sunrise on the upper east-facing slope; (c) whole facing slope in sunlight; (d) whole valley in sunlight; onset of valley wind; (e) west-facing slope receiving more solar radiation than east-facing slope; (f) solar radiation only tangential to east-facing slope; (g) sunset on east-facing slope and valley floor; (h) after sunset on the lower west-facing slope (from Urfer-Henneberger, 1970). 205
- 3.41 Plots of valley width/area (W/A) ratios (m^{-1}) along Brush Creek, Colorado (draining) and Gore Creek, Colorado (pooling) (from Whiteman, 1990, after McKee and O'Neal, 1989). 209
- 3.42 Sodar returns (above) and tethersonde observations (below) during drainage initiation in Willy's Gulch, Colorado, 16 September 1986. (Neff and King, 1989, *J. appl. Met.*, **28**, p. 522, Fig. 5). 210
- 3.43 Tubular stratocumulus cloud observed late morning in early September in a pass near Kremmling, Colorado. (G. Kiladis). 212
- 3.44 Schematic model of the interacting winds during valley inversion break-up (from Whiteman, 1982). 214
- 3.45 Regional-scale diurnal wind reversals over the Rocky Mountains, Colorado, based on mountain-top observations of average resultant wind from (a) 1200 to 1500 MST for 26 August 1985 and (b) 0001 to 0300 MST for 27 August 1985 (from Bossert *et al.*, 1989). 219
- 3.46 A model of nocturnal airflow over the Drakensberg foothills in winter (from Tyson and Preston-Whyte, 1972). 220
- 3.47 Time section of local winds ($m\ s^{-1}$) in and above Bushmans Valley, Drakensberg Mountains, 12–13 March 1965 (from Tyson, 1968b). 220
- 3.48 Conceptual model of the regional-scale circulation system over the inter-montane basins of the Colorado Rocky Mountains. (a) Daytime inflow; (b) transition phase; (c) nocturnal outflow (from Bossert and Cotton, 1994). 221
- 3.49 Conceptual model of a mountain–plains circulation east of the Front Range, Colorado (from Wolyn and McKee, 1994). 222
- 3.50 Schematic diagram of the diurnal circulation over the Bolivian Altiplano (from Egger *et al.*, 2005; Fig. 1). 224
- 3.51 Thermal winds developed in the steady-state boundary layer over sloping terrain in the northern hemisphere. The (a) nocturnal and (b) daytime phases of temperature stratification and associated geostrophic wind shear are shown (from Lettau, 1967). 225
- 4.1 The diurnal variation of surface energy fluxes averaged for 23–31 August 1985 at Mt. Werner (40.5° N, 106.7° W, 3250 m), Flat Tops (40.0° N, 107.3° W, 3441 m) and Crested Butte (38.9° N, 107.9° W, 3354 m), Colorado (adapted from Bossert and Cotton, 1994). 254
- 4.2 Hourly values of energy budget components in the Austrian Tyrol, 12 July 1977, at Obergürgl-Wiese (1960 m) and Hohe Mut (2560 m) (from Rott, 1979). 257

LIST OF FIGURES	xiv
4.3 Calculated net radiation on north- and south-facing slopes of 30° in the Caucasus at 400 m and 3600 m (based on Borzenkova, 1967).	258
4.4 Seasonal variations of net radiation and turbulent heat fluxes with altitude in Croatia (after Pleško and Šinik, 1978).	259
4.5 Slope temperatures on the Nordkette, Innsbruck, 2 April 1930 (after Wagner, 1930).	261
4.6 Equivalent black-body temperatures (T_{BB}) measured by radiation thermometer from an aircraft over Mt. Fuji, 0743–0756 JGT, 28 July 1967. Solar altitude and azimuth is shown since sunrise (from Fujita <i>et al.</i> , 1968).	263
4.7 Model of the thermal belt and cold air drainage on a mountain slope in central Japan (from Yoshino, 1984).	264
4.8 Mean monthly maxima (a) and minima (b) of air temperature (1954–5) near the forest limits on a west-northwest slope near Obergurgl (after Aulitsky, 1967).	265
4.9 Schematic illustration of the effects of a mountain barrier on cloud formation (modified after Banta, 1990).	267
4.10 Tephigram charts showing; (a) typical environment curves and atmospheric stability; (b) cloud formation following surface heating (from Barry and Chorley, 1987).	268
4.11 Observation of the daytime growth of cumulus over south-facing slopes in alpine terrain: (a) 0700 UTC; (b) 0900 UTC; (c) 1300 UTC (from Tucker 1954).	269
4.12 Low-level stratus filling the Swiss lowlands and valleys. (K. Steffen).	272
4.13 The diurnal frequency distributions with altitude of the tops of stratiform cloud observed from the Zugspitze in summer and winter, 1939–48 (after Hauer, 1950).	272
4.14 Schematic illustration of seeder–feeder clouds and enhancement of precipitation over a hill (from Browning and Hill, 1981).	273
4.15 Model of warm sector rainfall based on radar studies over the Welsh hills showing the role of potential instability in meso-scale precipitation areas (MPAs) and orography (from Browning <i>et al.</i> , 1974).	276
4.16 The relationship between altitude and orographic enhancement for eight cases of cyclonic precipitation in south Wales. The inset shows the effect of wind speed at 600 m on the enhancement of rainfall rates in the lowest 1500 m for the same cases (modified from Hill <i>et al.</i> , 1981).	277
4.17 Schematic profiles of mean annual precipitation (cm) versus altitude in equatorial climates, tropical climates, middle latitudes, and transitional regions.	284
4.18 Generalized profiles of mean annual precipitation (cm) versus altitude in the tropics (from Lauer, 1975).	285
4.19 The altitudinal profile of mean annual precipitation (cm) for Austria as a whole, for the Otzal in a lee situation and the Bregenz area in a windward situation (from Lauscher, 1976a).	285

LIST OF FIGURES	XV
4.20 The relationship between annual precipitation and topographic parameters: (a) an elevation–exposure index; (b) a slope–orientation index for mountain ranges in middle and low latitudes (from Basist <i>et al.</i> , 1994).	287
4.21 Empirical relationship between monthly mean temperature ($^{\circ}\text{C}$) and annual percentage frequency of solid precipitation in the northern hemisphere compared with the regression ($50-5T$) (from Lauscher, 1976b).	293
4.22 The average number of days with snow lying versus altitude on various mountains in Great Britain: (a) an average mountain in the west of Great Britain; (b) an average mountain in the whole of Great Britain; (c) an average mountain in central Scotland (from Jackson, 1978).	295
4.23 Snow cover depth and duration at different elevations in Austria (F. Steinhäuser, 1974).	296
4.24 The altitudinal gradient of winter precipitation (solid dots) determined from snow-course data and accumulation measured on glaciers in the Front Range, Colorado in 1970 expressed as snow water equivalent (from Alford, 1985).	297
4.25 Orographically induced vertical motion for a simple barrier with westerly flow: (a) $f(z) = 0$; (b) $k = 0$ (from Walker, 1961).	301
4.26 Calculated condensation and precipitation (mm h^{-1}) for the airflow case shown in Figure 4.25(b) (from Walker, 1961).	302
4.27 Model simulations for a storm with a westerly airflow over northern California, 21–23 December 1964: (a) computed steady-state vertical motion field (cm s^{-1}); (b) computed precipitation rate (solid line) and observed values (dots) (from Colton, 1976).	303
4.28 Precipitation rate (mm h^{-1}) for idealized terrain heights (km) in western Oregon according to the linear theory of Smith and Barstad (2004) (from Smith <i>et al.</i> , 2005).	305
4.29 Schematic summary of processes and problems involved in the determination of rain gauge catch (from Rodda, 1967).	307
4.30 WMO DFIR and Wyoming shield gauges (AGU, 2000).	309
4.31 The absence of any direct effect of the inclination angle of falling precipitation on gauge catch (from Peck, 1972a).	312
4.32 Annual rainfall and fog catch versus elevation on Mauna Loa, Hawaii. Left: lee slope. Right: windward slope. The percentage increase in annual total due to fog catch is shown at the elevations of measurements (after Juvik and Ekern, 1978).	318
4.33 (a) and (b) Rime needles (Hohenpeissenberg Observatory).	319
4.34 A weather screen on Mt. Coburg, Canadian Arctic (76°N , 79.3°W) heavily coated with rime ice (K. Steffen).	322
4.35 Modes of snow transport by the wind (from Mellor, 1965).	324
4.36 Snow drift accumulation, 1974–5 at a site on Niwot ridge, Colorado (3450 m) (after Berg and Caine, 1975).	326

LIST OF FIGURES	xvi
4.37 Penitents approximately 5 m high, formed by differential ablation on the Khumbu Glacier (5000 m) in the Nepal Himalaya (K. Steffen).	334
4.38 Estimated annual evaporation (cm) from water surfaces in central California based on pan measurements and meteorological data (after Longacre and Blaney, 1962).	338
4.39 Altitudinal profiles of mean annual precipitation (P), evaporation (E) and runoff (D) for the Swiss Alps (after Baumgartner <i>et al.</i> , 1983).	341
5.1 Generalized topography and annual rainfall (cm) along a cross-section northward from Akoma on the Gulf of Papua to Kundiawa (145° E, 6° S), then northeastward to Madang (from Barry 1978; based on a rainfall map produced by the Snowy Mountain Engineering Corporation, 1975).	365
5.2 Schematic view of daytime circulation, moisture advection, cloudiness and precipitation on Mt. Kenya (adapted from Winiger, 1981).	367
5.3 Schematic illustration of nocturnal precipitation in the central Himalaya (from Barros and Lang, 2003).	372
5.4 Precipitation gradients in the Annapurna region (adapted from Putkonen, 2004). Left: Altitudinal profile of October–May (solid) , June–September (dashed) and annual precipitation. Right: A south–north transect of total precipitation for 1 September 2000–31 August 2001 from Purkhot to the main crest of the Himalaya (after Putkonen, 2004).	373
5.5 Schematic cloud patterns in summer and winter in the Khumbu region, Nepal (after Yasunari, 1976a).	376
5.6 The range of mean monthly temperatures versus altitude in the Nepal Himalaya (after Dobremez, 1976).	378
5.7 Annual rainfall (mm) versus altitude in the Hoggar in a wet year and dry year (after Yacono, 1968).	379
5.8 Extent of precipitation systems affecting western and central North Africa and typical tracks of Sudano–Saharan depressions (after Dubief, 1962; Yacono, 1968).	380
5.9 Vertical gradients of annual precipitation in the Tien Shan and Pamir ranges. The values are scaled relative to the annual totals at the equilibrium line altitude (ELA) as estimated from the climatic snow line (adapted from Getker and Shchetinnikov, 1992).	383
5.10 Typical vertical gradients of maximum snow water equivalent (SWE) on macro-scale slopes in the Tien Shan and Pamir ranges (adapted from Getker, 1985).	384
5.11 Annual precipitation (mm) versus elevation (m) in the mountains of Central Asia. (a) Inylchek Glacier, Khan Tengry massif, central Tien Shan (ca. 42° N, 80° E) (Aizen <i>et al.</i> , 1997); (b) Hei He River basin, Qilian Shan, China (ca. 39° N, 100° E) (Kang <i>et al.</i> , 1999).	385
5.12 Snow on the Alps (MODIS) (NASA).	387
5.13 Annual precipitation regimes at selected stations in the western Alps for 1931–60 (based on Fliri, 1974).	387

LIST OF FIGURES	xvii
5.14 Annual precipitation over the Alps for 1966–95 based on a dense station network (see text) (simplified after Frei and Schär, 1998).	389
5.15 Mean annual precipitation (dashed) and elevation (solid line) for a south–north transect through the eastern Alps between the Gulf of Venice and Bavaria (based on Schwarb <i>et al.</i> , 2001).	391
5.16 North–south transects of precipitation for 1971–90 and actual evaporation for 1973–92 across the Swiss Alps (after Spreafico and Weingartner, 2005).	392
5.17 Diurnal fog frequency on the Bernese Plateau (a) and on an alpine summit (b) (from Wanner, 1979).	396
5.18 Percentage of the monthly precipitation falling as snow on Ben Nevis (1343 m), 1895–1904. Average (solid) and extremes (fine lines) (after Thom, 1974).	399
5.19 Precipitation regimes on the east slope of the Front Range, Colorado (40° N, 105.5° W) expressed as monthly percentages of the annual total (based on Greenland, 1989; the Sugarloaf record is for 1952–70; Barry, 1973).	403
5.20 The relation between precipitation and elevation for large storms in Colorado. (after Jarrett, 1990). Source: <i>Geomorphology</i> 3(2), 1990, R. D. Jarrett, p. 184, Figure 5. Elsevier, Amsterdam.	404
5.21 Ratios of mean and maximum gust speeds to 5-min mean wind speeds in Boulder, Colorado, compared with averages cited by H. H. Lettau and D. A. Haugen (from Brinkmann, 1973).	407
5.22 Temperature soundings at Yakutat and Whitehorse and lapse rates in the St. Elias region, July 1964 (from Marcus, 1965).	408
5.23 Observed and idealized profiles of accumulation rate (mm day ⁻¹) across the St. Elias Range based on snow-pit data (after Taylor-Barge, 1969).	411
5.24 Annual precipitation (mm) over the Tibetan Plateau and adjoining areas (adapted from Owen <i>et al.</i> , 2006).	414
5.25 The temperature in the lower troposphere in the austral summer, 2 July 1966, at Plateau Station (79° 15' S, 40° 30' E, 3625 m), East Antarctica (after Kuhn, 2004).	416
5.26 Surface winds over Antarctica (from Parish and Bromwich, 1991).	418
5.27 Antarctic annual accumulation (cm) (from Bromwich and Parish, 1998).	419
5.28 Temperatures at Summit, Greenland 1987–98 (after Shuman <i>et al.</i> , 2001).	420
5.29 Precipitation versus elevation on different slopes of the Venezuelan Andes (from Pulwarty <i>et al.</i> , 1998).	421
6.1 Altitudinal and diurnal variations of (a) air temperature (°C) and (b) environmental radiant temperature in the White Mountains, California, mid-July (from Terjung, 1970).	447
6.2 The index of windchill equivalent temperature versus air temperature and wind speed (based on Oszcewski and Bluestein, 2005; and Meteorological Service of Canada, 2005).	449

LIST OF FIGURES	xviii
6.3 Schematic illustration of the heat exchanges of a homeotherm for air temperatures between -40° and $+40^{\circ}\text{C}$ (from Webster, 1974a).	450
6.4 Schematic model of turbulent wake effects associated with airflow along a canyon: (a) oblique view of canyon; (b) airflow along the canyon (from Start <i>et al.</i> , 1975).	465
6.5 The dilution of an airborne plume flowing across nearby elevated terrain. Four zones of plume behavior and predicted vertical mass distribution are shown (after Start <i>et al.</i> , 1974).	465
7.1 Time series of (a) summer half-year and (b) winter half-year air temperatures ($^{\circ}\text{C}$) at Sonnblick Observatory, 1887–2000 (after Auer <i>et al.</i> , 2000). (Courtesy Zentralanstalt für Meteorologie und Geodynamik, Vienna.)	476
7.2 Changes from 1928–32 to 1968–72 in annual totals of sunshine hours at four stations in the Austrian lowlands (above) and at three mountain stations (below), plotted as a 5-year moving average (from Steinhauser, 1973).	478
7.3 Secular trends from 1900–1 to 1965–6 in the number of days with snow cover and total new snowfall as a percentage of the 1900–1 to 1959–60 mean value for four regions in Austria: western Austria, northern Alpine Foreland, northeast Austria, and southern Alps (from Steinhauser, 1970).	479
7.4 Variations in the front of the Lower Grindelwald Glacier, Switzerland, 1590–1970, relative to the 1970 terminal position (after Messerli <i>et al.</i> , 1978).	484
7.5 Percentage of Swiss glaciers showing advance (hatched) or retreat (white) of the terminus, 1879–80 to 1999–2000 (based on data provided by the World Glacier Monitoring Service, Zurich).	484

TABLES

1.1	The global area of mountains and high plateaus.	<i>page</i> 4
1.2	Mountain relief based on roughness classes, and the degree of dissection.	4
1.3	Principal mountain observatories.	8
2.1	Measures of continentality at selected mountain stations.	29
2.2	The standard atmosphere.	32
2.3	Altitude effect on (direct) solar radiation in an ideal atmosphere (W m^{-2}).	35
2.4	Direct radiation on a perpendicular surface at 47°N , as a percentage of the extraterrestrial total.	38
2.5	Relationships between clear-sky direct beam transmissivity (τ_p) of solar radiation with pressure level (p) and turbidity (k).	39
2.6	Altitude and cloudiness effects on global solar radiation in the Austrian Alps (W m^{-2}).	40
2.7	Solar radiation on a horizontal surface, under clear skies.	40
2.8	Altitude effects on sky radiation in the Austrian Alps (W m^{-2}).	42
2.9	Mean daily totals of diffuse radiation in the Alps with overcast conditions (W m^{-2}).	42
2.10	Mean values, 1975–9, of global radiation and ultraviolet radiation in the Bavarian Alps (W m^{-2}).	45
2.11	Altitude and cloudiness effects on infrared radiation in the Austrian Alps (for thick, low cloud) (W m^{-2}).	48
2.12	Mean net radiation at different altitudes in Austria (W m^{-2}).	50
2.13	Components of the daily temperature fluctuation, Austrian Alps.	60
2.14	Mean temperature differences between the Brocken (1134 m) and the free atmosphere at Wernigerode, April 1957–March 1962.	61
2.15	Frequency (%) of temperature differences, Zugspitze minus free air, 1910–28.	61
2.16	Average temperature differences, Zugspitze minus free air, according to cloud conditions.	61
2.17	Calculated slope radiation components for Churchill, Manitoba, in December and June ($\text{MJ m}^{-2} \text{day}^{-1}$).	92
2.18	Global solar radiation in valley locations in Austria as a percentage of that on a horizontal surface for different cloud conditions.	105
2.19	Calculated direct beam solar radiation and net radiation for horizontal and sloping surfaces in the Caucasus.	106

LIST OF TABLES	XX
2.20 Latent heat fluxes ($W m^{-2}$) and Bowen ratio at three sites in Chitistone Pass, Alaska for 11 days in July–August.	107
3.1 The representation of topography in a 1° input grid and three triangular truncations of a spectral grid.	130
3.2 Mean conditions during bora in January at Senj, Slovenia.	176
3.3 Climatological characteristics for winter bora days expressed as differences (Split–Zagreb).	177
3.4 Minimum temperatures on the basin floor and at the lowest saddle and the vertical temperature gradient for sinkholes near Lunz, Austria.	190
3.5 Mean mass budgets of mountain and valley winds during MERKUR.	207
4.1 Daily averages of global solar radiation on the east slope of the Front Range, Colorado.	252
4.2 Selected energy budget data.	256
4.3 Annual turbulent fluxes in the Caucasus.	259
4.4 Ratios of precipitation measured at Valdai, Russia, by Tretyakov gauges with various fence configurations compared with a control gauge surrounded by bushes.	310
4.5 Excess catch of snow in a sheltered location versus open terrain.	313
4.6 Characteristics of rime deposits.	321
4.7 Snow evaporation, condensation and the balance at the Sonnblick (3106 m), October 1969–September 1976.	336
4.8 Day- and night-time Bowen ratio estimates of evaporation and condensation during 7–30 August 1998 at three sites in the Dischma Valley, Switzerland.	340
5.1 Precipitation in eastern Nepal–Sikkim–southern Tibet, between approximately 86.5° – 89° E.	369
5.2 Mean monthly temperature ($T^\circ C$) and precipitation (P , mm) for 1968–88 at the former Abramov Glacier moraine station, Alai Range.	381
5.3 Mean monthly temperature, Sept. 1934–Dec. 1989 ($^\circ C$) and precipitation, Jan. 1937–Dec. 1989 (mm) at the Fedtchenko Glacier station, Pamir.	382
5.4 Generalized amounts of solid precipitation and maximum snow water equivalent (SWE) in the mountains of Central Asia.	384
5.5 District averages of seasonal precipitation characteristics for the Alps.	390
5.6 Mean potential temperature during 12 cases each of north föhn and south föhn, 1942–5.	394
5.7 Characteristics of south föhn in the eastern Alps and Foreland.	394
5.8 A profile of winter storm precipitation across the Colorado Rockies for 265 storms during winters 1960/1–1967/8.	404
5.9 Summer climatic data for the St. Elias Mountains.	409
5.10 Mean daily maximum and minimum air temperatures ($^\circ C$) at the Observatorio del Infiernillo for the warmest and coldest months of 1962–5.	424
6.1 US Forest Service guide to lightning activity level (LAL).	456

PREFACE TO THE THIRD EDITION

Research into mountain weather and climate has gained momentum over the 15 years that have elapsed since the publication of the second edition. Studies of the meteorology and climatology of mountains regions of Central Asia and South America, in particular, have provided material for new sections in Chapter 5, with shorter sections on the equatorial mountains of East Africa and the Southern Alps of New Zealand. The high ice plateaus of Greenland and Antarctica are also included. There has also been more attention paid to changes in mountain environments, as part of the widening concern over global warming and through the International Panel on Climate Change (IPCC) for its second (1995), third (2001), and fourth (2007) assessment reports. Accordingly, the scope of the material in Chapter 7 has expanded. Research in mountain meteorology has benefited from projects such as the Mesoscale Alpine Program (MAP) and other more local individual endeavors in different parts of the world. Improvements in instrumentation, data recording and transmitting, and new satellite, airborne and ground-based remote sensing, are all changing the ways in which data can be collected. Data analysis, combined with higher resolution numerical modeling, is also becoming increasingly common.

The basic structure of the book remains unchanged, and apart from updating throughout, and corrections where appropriate, most of the original text has been retained. I believe firmly in recognizing important early contributions to the subject, as well as the latest advances. Some recent references incorporated in the bibliographies are not discussed in the text.

ACKNOWLEDGMENTS

I am particularly grateful to Matt Lloyd of Cambridge University Press for supporting my proposal for a new Third Edition of the book and to Andrew Mould of Routledge, Taylor, and Francis, for facilitating the transfer of publication rights.

Daryl Kohlerschmidt of the clerical staff at NSIDC helped greatly with the final text formatting, while student Naomi Saliman ably prepared new and revised figures and scanned all artwork, and Amy Borrows = Poretsky handled figure permissions, both supervised by Cindy Brekke. NSIDC library staff assisted with locating literature not available electronically.

For answers to questions and for provision of reports and articles, I am grateful to Ingeborg Auer, Tanja Cegnar, Josef Egger, Christoph Frei, Doug Hardy, Louis Lliboutry, Gudrun Petersen, Mike Prentice, Rolf Philipona, Raymond Pierrehumbert, Hans Richner, Bruno Schaedler, Glenn Shutts, Mathias Vuille, Rolf Weingartner, David Whiteman, and Masatsoshi Yoshino.

I wish to thank the following for permission to reproduce illustrations: first and foremost are the American Geophysical Union and American Meteorological Society for their enlightened policies on figure reproduction, which so greatly simplify and speed up the process of preparing an academic text. Wherever possible, figures from papers in their journals are used for this reason.

The following individuals and publishers have kindly granted permission for the reproduction of illustrations and other material:

Dr. V. Aizen – Figure 5.11a

American Geophysical Union – Figures 2.11, 2.23, 2.24

American Meteorological Society – Figures 2.14, 2.20, 2.21, 2.27, 3.1, 3.2, 3.3a, 3.5, 3.11, 3.17, 3.28, 3.31, 3.36, 3.37, 3.39, 3.41, 3.44, 3.45, 3.46, 3.48, 3.49, 4.1, 4.8, 4.9, 4.20, 4.28, 5.3, 5.26, 5.27, 5.28, 6.2
