Preface page xii

1	Sound and the auditory system	1
	The nature of auditory stimuli	1
	Our auditory apparatus	5
	<i>The outer ear and the middle ear</i>	5
	<i>Structure of the inner ear</i>	9
	<i>Neural structures and auditory pathways</i>	13
	Mechanics for stimulation within the inner ear	16
	The auditory-acoustic paradox: excellent discrimination from a poor instrument	22
	Electrophysiological response of the cochlea and peripheral neural apparatus	23
	<i>The resting potential</i>	23
	<i>The summing potential</i>	23
	<i>The cochlear microphonic</i>	24
	<i>Whole-nerve action potential</i>	25
	<i>Single-unit receptor potentials</i>	25
	<i>Single-unit generator potentials</i>	26
	<i>Action potentials of auditory nerve fibers</i>	27
	Investigation of human cortical function	31
	<i>fMRI</i>	31
	<i>PET</i>	32
	<i>EEG and MEG</i>	33
	Suggestions for further reading	34
2	Spatial localization and binaural hearing	35
	Binaural perception of azimuth	36

viii Contents

<i>Minimal audible angle</i>	40
Binaural beats	41
Detection of interaural delays for clicks and for complex sounds	42
Contralateral induction	45
Masking level differences	48
Two types of temporal disparity	50
Time-intensity trading	51
Some cautions concerning interpretation of studies using headphones	52
Importance of the pinnae in sound localization	52
Room acoustics	56
Auditory reorientation	57
Estimates of distance from the source	59
Sensory input and physical correlates	63
Suggestions for further reading	63

3 Perception of acoustic repetition: pitch and infrapitch 64

Terminology	64
Classical pitch studies	65
Masking	69
Critical bands	72
Comodulation and masking reduction	72
Place theory of pitch	74
Periodicity theory of pitch	75
<i>Schouten's residue pitch</i>	76
Pitch of inharmonic complexes	77
Spectral dominance	79
Complex tones and local temporal patterns on the basilar membrane	79
Use of special versus model periodic stimuli	82
<i>Iterated noise segments as representative or model periodic sounds</i>	83
Pitch and infrapitch iterance	85
Echo pitch and infrapitch echo	91
Periodic signals with alternating polarity	95
Pitches produced by dichotic interactions	101
Ear dominance for perception of pitch	102
Musical pitch and musical infrapitch (rhythm)	102
Deviations from strict periodicity in the pitch range	103
Some models for the pitch of complex tones	104
Suggestions for further reading	105

4 Judging auditory magnitudes: the sone scale of loudness and the mel scale of pitch 107

Sensory input and perception 107

The history of loudness measurement 108

Loudness judgments and their relation to auditory

localization: the physical correlate theory 111

1. *Equivalence of half-loudness and twice distance estimates* 113

2. *Loudness and the inverse square law* 113

3. *Effects of reverberation on loudness functions* 117

4. *Loudness of self-generated sound* 119

5. *A new physical correlate can result in a new loudness scale* 121

The mel scale of pitch magnitude 122

Some conclusions and inferences 124

Suggestions for further reading 125

5 Perception of acoustic sequences 126

Rate at which component sounds occur in speech and music 126

Identification of components and their order 127

Identification of the order of components for extended sequences of unrelated sounds and for steady-state phonemes 129

Identification of order within tonal sequences 130

Limits of stream segregation as an explanatory principle 131

Identification of order and verbal labeling 131

Need for verbal labeling for serial order retention in memory experiments 133

Identification of patterns without discrimination of order:

global pattern recognition 134

Extent of temporal mismatch permitting global pattern recognition 136

Should practiced or unpracticed subjects be used in sequence experiments? 138

A comparison of global pattern recognition with identification of the order of components 138

Perception of tonal sequences and melodies 142

Acoustic sequences as unresolved “temporal compounds” 146

Linguistic temporal compounds formed by repeating sequences of brief steady-state vowels 146

Identification of components and their orders and

global pattern recognition for dichotomous patterns 147

Global pattern recognition in animals other than humans 147

Conclusions 149

Suggestions for further reading 149

x Contents

6 Perceptual restoration of missing sounds	150
Temporal induction	151
<i>Homophonic continuity</i>	151
<i>Heterophonic continuity</i>	152
<i>The roll effect as tonal restoration</i>	156
<i>Durational limits for illusory continuity</i>	156
<i>Reciprocal changes in inducer and inducee</i>	156
<i>Alternating levels of the same sound: some anomalous effects observed for the higher level sound in the homophonic induction of tones</i>	159
<i>Differences in the homophonic induction of tone and noise</i>	160
<i>Binaural release from temporal induction</i>	161
Temporal induction of dynamic signals	161
<i>Temporal induction of tonal frequency glides</i>	161
<i>Temporal induction of speech: phonemic restoration</i>	162
<i>Apparent continuity of speech produced by insertion of noise into multiple gaps</i>	164
<i>Increase in intelligibility produced by insertion of noise into multiple temporal gaps</i>	166
<i>Temporal induction in cats and monkeys</i>	169
Spectral restoration	170
Masking and unmasking	172
Suggestions for further reading	172
7 Speech	174
Speech production	174
<i>The subglottal system</i>	175
<i>The larynx</i>	176
<i>The vocal tract and articulation of speech sounds</i>	178
Visual representation of speech sounds	183
Intelligibility of sentences heard through narrow spectral slits	186
Intelligibilities of passbands heard singly and together	189
The protean phoneme	190
Are phonemes perceptual units?	194
<i>The alphabet and the phoneme</i>	194
<i>Illiterate adults cannot segment phonetically</i>	195
<i>Ability to segment phonetically and reading ability are related in children</i>	196
<i>Cues for identifying phonemes and characterizing letters</i>	197
<i>Phonemes in speech are not perceived, but are inferred</i>	198
<i>“Restored” and “real” phonemes are perceptually equivalent</i>	198
<i>Identification of syllables and words precedes identification of constituent phonemes</i>	198

Contents xi

Obligatory transformation of brief steady-state phonemes into syllables and words: the vowel-sequence illusion	199
<i>Implications of the vowel-sequence illusion for theories of aphasia</i>	202
Perceptual changes occurring during repetition of syllables and words	203
<i>Verbal and visual satiation</i>	203
<i>Verbal transformations</i>	205
<i>Identifying lexical neighbors using verbal transformations</i>	208
Dichotic verbal transformations	209
The relation between production and perception of speech: organization above the lexical level	211
<i>Skilled storage and delayed perceptual organization of speech</i>	211
Speech errors in everyday life	213
Syllable recognition by nonhuman species	214
Suggestions for further reading	215
8 The relation of hearing to perception in general	216
Multimodal perception	216
<i>Interaction of vision with senses other than hearing</i>	216
<i>Interaction of vision and hearing in speech perception</i>	217
Perceptual resolution of conflicting visual and auditory information concerning speech	218
<i>Multimodal sensory control of speech production</i>	219
General perceptual rules and modality-specific rules	220
1. <i>Sensory input is interpreted in terms of familiar causative agents or events, and not in terms of the manner and nature of neural stimulation</i>	220
2. <i>Perceptual changes occur during exposure to an unchanging stimulus pattern</i>	221
3. <i>Prior stimulation influences perceptual criteria</i>	222
Suggestions for further reading	224
