<i>Preface</i>	<i>page</i> xiii
<i>Acknowledgments</i>	xviii
1 Newtonian gravity	1
1.1 Classical mechanics	1
1.2 The classical Lagrangian	2
1.2.1 Lagrangian and equations of motion	2
1.2.2 Examples	5
1.3 Lagrangian for $U(r)$	7
1.3.1 The metric	9
1.3.2 Lagrangian redux	12
1.4 Classical orbital motion	16
1.5 Basic tensor definitions	21
1.6 Hamiltonian definition	25
1.6.1 Legendre transformation	26
1.6.2 Hamiltonian equations of motion	30
1.6.3 Canonical transformations	33
1.6.4 Generating functions	34
1.7 Hamiltonian and transformation	37
1.7.1 Canonical infinitesimal transformations	37
1.7.2 Rewriting H	39
1.7.3 A special type of transformation	43
1.8 Hamiltonian solution for Newtonian orbits	46
1.8.1 Interpreting the Killing vector	46
1.8.2 Temporal evolution	52
2 Relativistic mechanics	56
2.1 Minkowski metric	57

viii	<i>Contents</i>	
2.2	Lagrangian	61
2.2.1	Euclidean length extremization	61
2.2.2	Relativistic length extremization	63
2.3	Lorentz transformations	67
2.3.1	Infinitesimal transformations	67
2.4	Relativistic Hamiltonian	71
2.5	Relativistic solutions	74
2.5.1	Free particle motion	75
2.5.2	Motion under a constant force	76
2.5.3	Motion under the spring potential	78
2.5.4	The twin paradox with springs	80
2.5.5	Electromagnetic infall	82
2.5.6	Electromagnetic circular orbits	83
2.5.7	General speed limit	85
2.5.8	From whence, the force?	86
2.6	Newtonian gravity and special relativity	87
2.6.1	Newtonian gravity	87
2.6.2	Lines of mass	89
2.6.3	Electromagnetic salvation	92
2.6.4	Conclusion	93
2.7	What's next	94
3	Tensors	98
3.1	Introduction in two dimensions	99
3.1.1	Rotation	99
3.1.2	Scalar	101
3.1.3	Vector (contravariant) and bases	102
3.1.4	Non-orthogonal axes	104
3.1.5	Covariant tensor transformation	106
3.2	Derivatives	111
3.2.1	What is a tensorial derivative?	112
3.3	Derivative along a curve	117
3.3.1	Parallel transport	117
3.3.2	Geodesics	122
4	Curved space	127
4.1	Extremal lengths	128
4.2	Cross derivative (in)equality	129
4.2.1	Scalar fields	130
4.2.2	Vector fields	130
4.3	Interpretation	132
4.3.1	Flat spaces	134

<i>Contents</i>		ix
4.4	Curves and surfaces	137
4.4.1	Curves	137
4.4.2	Higher dimension	140
4.5	Taking stock	144
4.5.1	Properties of the Riemann tensor	145
4.5.2	Normal coordinates	146
4.5.3	Summary	150
4.6	Equivalence principles	152
4.6.1	Newtonian gravity	152
4.6.2	Equivalence	153
4.7	The field equations	157
4.7.1	Equations of motion	157
4.7.2	Newtonian deviation	158
4.7.3	Geodesic deviation in a general space-time	159
4.8	Einstein's equation	162
5	Scalar field theory	167
5.1	Lagrangians for fields	167
5.1.1	The continuum limit for equations of motion	170
5.1.2	The continuum limit for the Lagrangian	173
5.2	Multidimensional action principle	174
5.2.1	One-dimensional variation	175
5.2.2	Two-dimensional variation	177
5.3	Vacuum fields	178
5.4	Integral transformations and the action	181
5.4.1	Coordinate transformation	181
5.4.2	Final form of field action	183
5.5	Transformation of the densities	184
5.5.1	Tensor density derivatives	185
5.6	Continuity equations	188
5.6.1	Coordinates and conservation	189
5.7	The stress–energy tensor	192
5.7.1	The tensor $T^{\mu\nu}$ for fields	192
5.7.2	Conservation of angular momentum	195
5.8	Stress tensors, particles, and fields	197
5.8.1	Energy–momentum tensor for particles	197
5.8.2	Energy and momenta for fields	199
5.9	First-order action	200
6	Tensor field theory	205
6.1	Vector action	206
6.1.1	The field strength tensor	210

x	<i>Contents</i>	
6.2	Energy–momentum tensor for E&M	211
6.2.1	Units	212
6.3	E&M and sources	213
6.3.1	Introducing sources	214
6.3.2	Kernel of variation	216
6.4	Scalar fields and gauge	218
6.4.1	Two scalar fields	218
6.4.2	Current and coupling	220
6.4.3	Local gauge invariance	222
6.5	Construction of field theories	225
6.5.1	Available terms for scalar fields	226
6.5.2	Available terms for vector fields	226
6.5.3	One last ingredient	229
6.6	Second-rank tensor field theory	231
6.6.1	General, symmetric free field equations	231
6.7	Second-rank consistency	236
6.7.1	Modified action variation	237
6.7.2	Stress tensor for $H^{\mu\nu}$	239
6.7.3	Matter coupling	243
6.8	Source-free solutions	245
7	Schwarzschild space-time	251
7.1	The Schwarzschild solution	253
7.1.1	The Weyl method and E&M	254
7.1.2	The Weyl method and GR	255
7.2	Linearized gravity	260
7.2.1	Return to linearized field equations	260
7.3	Orbital motion in Schwarzschild geometry	264
7.3.1	Newtonian recap	265
7.3.2	Massive test particles in Schwarzschild geometry	265
7.3.3	Exact solutions	271
7.4	Bending of light in Schwarzschild geometry	272
7.5	Radial infall in Schwarzschild geometry	277
7.5.1	Massive particles	278
7.5.2	Light	280
7.6	Light-like infall and coordinates	281
7.6.1	Transformation	281
7.7	Final physics of Schwarzschild	285
7.7.1	Black holes	285
7.7.2	Gravitational redshift in Schwarzschild geometry	286
7.7.3	Real material infall	287
7.8	Cosmological constant	293

	<i>Contents</i>	xi
8	Gravitational radiation	296
8.1	Gauge choice in E&M	297
8.2	Gauge choice in linearized GR	299
8.3	Source-free linearized gravity	302
8.4	Sources of radiation	305
8.4.1	Source approximations and manipulation	311
8.4.2	Example – circular orbits	315
8.4.3	Energy carried away in the field	318
9	Additional topics	327
9.1	Linearized Kerr	328
9.1.1	Spinning charged spheres	328
9.1.2	Static analogy	329
9.1.3	General relativity and test particles	330
9.1.4	Kerr and the weak field	331
9.1.5	Physics of Kerr	333
9.2	Kerr geodesics	334
9.2.1	Geodesic Lagrangian	334
9.2.2	Runge–Kutta	337
9.2.3	Equatorial geodesic example	339
9.3	Area minimization	340
9.3.1	Surfaces	340
9.3.2	Surface variation	342
9.3.3	Relativistic string	345
9.4	A relativistic string solution	347
9.4.1	Nambu–Goto variation	348
9.4.2	Temporal string parametrization	350
9.4.3	A σ string parametrization (arc-length)	350
9.4.4	Equations of motion	352
9.4.5	A rotating string	354
9.4.6	Arc length parametrization for the rotating string	355
9.4.7	Classical correspondence	357
