

Contents

	<i>Preface</i>	<i>page</i> ix
	<i>Contributors</i>	xi
1	Small-Scale Statistics and Structure of Turbulence – in the Light of High Resolution Direct Numerical Simulation	1
	<i>Yukio Kaneda and Koji Morishita</i>	
	1.1 Introduction	1
	1.2 Background supporting the idea of universality	2
	1.3 Examination of the ideas underlying the 4/5 law	7
	1.4 Intermittency of dissipation rate and velocity gradients	14
	1.5 Local structure	21
	1.6 Inertial subrange	28
	1.7 Concluding remarks	34
	References	35
2	Structure and Dynamics of Vorticity in Turbulence	43
	<i>Jörg Schumacher, Robert M. Kerr and Kiyosi Horiuti</i>	
	2.1 Introduction	43
	2.2 Basic relations	44
	2.3 Temporal growth of vorticity	52
	2.4 Spatial structure of the turbulent vorticity field	60
	2.5 Vorticity statistics in turbulence	73
	References	80
3	Passive Scalar Transport in Turbulence: A Computational Perspective	87
	<i>T. Gotoh and P.K. Yeung</i>	
	3.1 Introduction	87
	3.2 Computational perspective	89

vi	<i>Contents</i>	
	3.3 Background theory	93
	3.4 Approach to low-order asymptotic state	95
	3.5 High-order statistics: fine-scale structure and intermit-	
	tency	108
	3.6 Concluding remarks	121
	References	124
4	A Lagrangian View of Turbulent Dispersion and Mixing	132
	<i>Brian L. Sawford and Jean-François Pinton</i>	
	4.1 Introduction	132
	4.2 Single particle motion and absolute dispersion	135
	4.3 Two particle motion and relative dispersion	153
	4.4 n -particle statistics	162
	4.5 Conclusions	165
	References	167
5	The Eddies and Scales of Wall Turbulence	176
	<i>Ivan Marusic and Ronald J. Adrian</i>	
	5.1 Introduction	176
	5.2 Background	179
	5.3 Scales of coherent structures in wall turbulence	190
	5.4 Relationship between statistical fine-scales and eddy	
	scales	206
	5.5 Summary and conclusions	209
	References	214
6	Dynamics of Wall-Bounded Turbulence	221
	<i>J. Jiménez and G. Kawahara</i>	
	6.1 Introduction	221
	6.2 The classical theory of wall-bounded turbulence	227
	6.3 The dynamics of the near-wall region	231
	6.4 The logarithmic and outer layers	241
	6.5 Coherent structures and dynamical systems	249
	6.6 Conclusions	260
	References	261
7	Recent Progress in Stratified Turbulence	269
	<i>James J. Riley and Erik Lindborg</i>	
	7.1 Introduction	269
	7.2 Scaling, cascade and spectra	271
	7.3 Numerical simulations	282
	7.4 Laboratory experiments	292
	7.5 Field data	297

Cambridge University Press

978-0-521-76944-0 - Ten Chapters in Turbulence

Edited by Peter A. Davidson, Yukio Kaneda and Katepalli R. Sreenivasan

Table of Contents

[More information](#)

<i>Contents</i>		vii
7.6	Conclusions	309
	Appendix	311
	References	312
8	Rapidly-Rotating Turbulence: An Experimental Perspective	318
	<i>P.A. Davidson</i>	
8.1	The evidence of the early experiments	318
8.2	Background: inertial waves and the formation of Taylor columns	321
8.3	The spontaneous growth of Taylor columns from compact eddies at low Ro	325
8.4	Anisotropic structuring via nonlinear wave interactions: resonant triads	332
8.5	Recent experimental evidence on inertial waves and columnar vortex formation	337
8.6	The cyclone–anticyclone asymmetry: speculative cartoons	343
8.7	The rate of energy decay	345
8.8	Concluding remarks	347
	References	348
9	MHD Dynamos and Turbulence	351
	<i>S.M. Tobias, F. Cattaneo and S. Boldyrev</i>	
9.1	Introduction	351
9.2	Dynamo	356
9.3	Mean field	374
9.4	Conclusions	394
	References	397
10	How Similar is Quantum Turbulence to Classical Turbulence?	405
	<i>Ladislav Skrbek and Katepalli R. Sreenivasan</i>	
10.1	Introduction	405
10.2	Preliminary remarks on decaying QT	410
10.3	Comparisons between QT and HIT: energy spectrum	417
10.4	Decaying vorticity	422
10.5	Decay of HIT when the shape of the energy spectra matters	425
10.6	Effective viscosity	429
10.7	Conclusions	431
	References	432
