Preface		ix
Acknowledgements		xvi
1 Introduction		1
1.1 <i>N</i> -body problems		2
1.2 Problems and applications		3
1.3 Constrained dynamics		6
1.4 Exercises		8
2 Numerical methods		11
2.1 One-step methods		13
2.2 Numerical example: the Lennard–Jones oscillator		18
2.3 Higher-order methods		20
2.4 Runge–Kutta methods		22
2.5 Partitioned Runge–Kutta methods		25
2.6 Stability and eigenvalues		27
2.7 Exercises		32
3 Hamiltonian mechanics		36
3.1 Canonical and noncanonical Hamiltonian systems		36
3.2 Examples of Hamiltonian systems		39
3.3 First integrals		44
3.4 The flow map and variational equations		48
3.5 Symplectic maps and Hamiltonian flow maps		52
3.6 Differential forms and the wedge product		61
3.7 Exercises		66
4 Geometric integrators		70
4.1 Symplectic maps and methods		74

4.2	Construction of symplectic methods by Hamiltonian splitting . . .	76
4.3	Time-reversal symmetry and reversible discretizations	81
4.4	First integrals	87
4.5	Case studies	91
4.6	Exercises	99
5	The modified equations	105
5.1	Forward v. backward error analysis	107
5.2	The modified equations	117
5.3	Geometric integration and modified equations	129
5.4	Modified equations for composition methods	133
5.5	Exercises	139
6	Higher-order methods	142
6.1	Construction of higher-order methods	143
6.2	Composition methods	144
6.3	Runge–Kutta methods	149
6.4	Generating functions	159
6.5	Numerical experiments	161
6.6	Exercises	165
7	Constrained mechanical systems	169
7.1	N -body systems with holonomic constraints	170
7.2	Numerical methods for constraints	173
7.3	Transition to Hamiltonian mechanics	184
7.4	The symplectic structure with constraints	186
7.5	Direct symplectic discretization	188
7.6	Alternative approaches to constrained integration	191
7.7	Exercises	195
8	Rigid body dynamics	199
8.1	Rigid bodies as constrained systems	201
8.2	Angular momentum and the inertia tensor	210
8.3	The Euler equations of rigid body motion	212
8.4	Order 4 and order 6 variants of RATTLE for the free rigid body	223
8.5	Freely moving rigid bodies	224
8.6	Other formulations for rigid body motion	228
8.7	Exercises	230
9	Adaptive geometric integrators	234
9.1	Sundman and Poincaré transformations	235

<i>Contents</i>	vii
9.2 Reversible variable stepsize integration	238
9.3 Sundman transformations	246
9.4 Backward error analysis	249
9.5 Generalized reversible adaptive methods	251
9.6 Poincaré transformations	253
9.7 Exercises	255
10 Highly oscillatory problems	257
10.1 Large timestep methods	258
10.2 Averaging and reduced equations	269
10.3 The reversible averaging (RA) method	271
10.4 The mollified impulse (MOLLY) method	276
10.5 Multiple frequency systems	279
10.6 Exercises	280
11 Molecular dynamics	287
11.1 From liquids to biopolymers	290
11.2 Statistical mechanics from MD trajectories	296
11.3 Dynamical formulations for the NVT, NPT and other ensembles	299
11.4 A symplectic approach: the Nosé–Poincaré method	305
11.5 Exercises	313
12 Hamiltonian PDEs	316
12.1 Examples of Hamiltonian PDEs	316
12.2 Symplectic discretizations	325
12.3 Multi-symplectic PDEs	335
12.4 Exercises	352
