## Subject Index

- aggregative fluidization, 99, 153
- angle of repose, 144
- angular momentum equation
  - particle phase average, 24, 25
  - single particle, 24
- averages, ensemble, 18
- averages, local spatial
  - comparison with ensemble averages, 18, 60–2
  - dependence on separation of scales, 19
  - fluid-particle force, 23, 27, 35
  - fluid phase; definition, 20
  - fluid phase; differentiation, 20
  - hard, 19
  - mass weighted; definition, 21
  - overall; definition, 19
  - particle-particle force, 24
  - particle phase; definition, 21
  - particle phase; differentiation, 22
  - radius of, 19
  - soft, 19
  - solid phase; definition, 21
  - weighting functions for, 19
- bed height
  - measurements of, 91–3, 95–6
  - prediction of, 83–9
- bifurcations
  - one-dimensional structures, 189–91, 221–2
  - theory of Göz, 227
  - two-dimensional structures, 203–10, 223–4
- boundary conditions
  - momentum, for gas phase, 241–3
  - momentum, for particle phase, 239–40
  - pseudo-thermal energy, 240–1
- bubbles
  - Collins' model of, 174–5
  - Davidson cloud accompanying, 159, 160–2, 176–8, 206, 211
  - Davidson's model of, 157–63
  - fluid pressure field near, 179
  - fluid streamlines near, 160, 161, 168, 169, 172, 173, 175, 214
  - growth of, computed, 208–16, 227–29
  - Jackson's model of, 163–7
  - Murray's model of, 167–73
  - photographs of, 154, 155
  - pressure, effect on, 156–7
  - relation to clusters, 221–4
  - rise velocity, 165, 172
  - tracer injection study of, 160–3
  - void fraction near, 167, 179–82
  - X-ray studies of, 154–5, 182
- bulk density, 18
- buoyancy, 26–32
- catalytic cracking, 15, 233, 298
- closures for averaged quantities
  - effective fluid phase stress, 34, 38, 54–5
  - effective particle phase stress, 38, 39–40, 41, 54–5
  - fluid-particle interaction force, 35, 38, 39, 41, 48–53
  - fluid phase stress, 33
  - pseudothermal energy flux, 38, 39–40
- compressor characteristics, 8
- computational fluid dynamics (CFD), 2, 288–95
- consolidation loci, 68–9
- continuity equations, 22
  - linearized form, 104
- continuity waves, 110
  - and stability criterion, 120
- cyclone, 300

- diffusion coefficient for particles, 120, 225–6  
 discrete particle models, 3  
 drag force, 5, 48–52  
   Buyevich's expression, 39, 51  
   Ergun's expression, 51  
   Ishii-Zuber expression, 50–1  
   Koch's expression, 38  
   Koch & Sangani's expression, 41  
   Richardson-Zaki expression, 5, 49–50, 103  
   Stokes, 35, 51  
 dynamical waves, 110  
   and stability criterion, 120  
 eigenfunctions, 202, 204  
 Einstein viscosity correction, 35  
 energy, pseudothermal, 37–8, 142  
   balance equation for, 37, 42, 237, 239, 279  
   flux vector of, 37, 38, 39, 238, 240, 280  
   sources and sinks of, 37, 38, 39, 42, 238, 280, 284  
 failure loci, 67–8  
 Faxen force, 35, 48  
 flow rule, 73  
 fluid cracking catalyst (FCC), 91–6, 101, 121–3, 144, 289, 300, 330  
 Geldart classification, 155–6, 300  
 granular materials  
   and large Stokes number suspensions, 37  
   asymptotic shear stress in, 67–8  
   consolidation and strengthening in, 69, 75  
   consolidation loci for, 68–9  
   constitutive relations for, 70–8  
   critical state of, 73  
   failure and weakening in, 67–8, 74–5  
   failure loci for, 67–8  
   instability under shear, 236  
   plane shear of, 66–70  
   shear stress for consolidation, 68  
   shear stress for failure, 66–7  
   yield loci for, 72–5  
   yield stress in, 66–7  
 gravity force vector, 22  
   effective, for observer in motion, 28  
 hopper, 301–2, 303–4, 306–8, 311–12  
 hysteresis  
   in standpipe performance, 314–15, 326  
   observed in fluidization–defluidization, 91–3  
   predicted in fluidization–defluidization, 86–9  
 instabilities  
   and shock formation, 183–4, 196  
   circulatory in bounded fluidized bed, 145–50  
   comparison of predictions and observations, 137–42  
   computational studies of, 102, 192–5, 208–19  
   dispersion relations for, 107–17, 188, 201, 203  
   dominant instabilities in fluidized beds, 124–30  
   experimental observations of, 130–7  
   in typical air and water fluidized beds, 129–31  
   two-dimensional, 102, 199–203  
   with pseudothermal energy balance, 142–4  
 Janssen approximation, 80, 308  
 lift force, 48, 52–3  
 mixing length, 280  
 Mohr circle construction, 71–2  
 momentum equations  
   averaged for fluid, 23, 24, 26–7, 29–32  
   averaged for mixture, 26  
   averaged for particle phase, 23, 24, 26–7, 29–32  
   closures for small Stokes number, 35  
   closures of Buyevich, 39–40, 44–6  
   closures of Foscolo & Gibilaro, 32, 46–7  
   closures of Koch, 38, 45–6  
   closures of Koch & Sangani, 40–4  
   empirical closures, 48–56  
   explicit forms for stability analysis, 103–4  
   linearized about uniformly fluidized state, 104  
   point for fluid, 22  
   short relaxation time approximation to, 56–9  
   single particle, 23  
 number density, 21  
 particle temperature  
   and particle distribution in risers, 254  
   anisotropy of, 41  
   definition, 37  
   differential equation for, 37, 42, 237, 239, 279  
   radial profile in riser, 281  
 particulate fluidization, 99, 153  
 pressure drop, fluid phase  
   in fluidization, 83, 84, 85, 86, 87, 88, 92–3  
   in vertical pipe flow, 9  
 pressure gradient, fluid phase  
   in fluidized bed, 82  
   in riser flow, 243–6, 251, 254, 266, 269, 270, 271, 274, 285–6

- in standpipe flow, 298, 302–3, 308, 318–21
  - in vertical pipe flow, 6, 7, 10, 12
  - near bubble, 179
- pressure, particle phase, 38, 39, 54–5, 81, 100
  - closures for, 38, 39, 41, 83, 119, 186, 222, 238
  - experimental estimates of, 140–1
  - stabilization of fluidized bed by, 100, 118
  - time average, 258, 261, 264
- relaxation time, fluid-particle, 56
- Reynolds number, 34, 40
  - at terminal velocity, 49
  - relation to drag coefficient, 50
  - table of typical values, 47
- riser flow, developing
  - CFD modelling of, 288–95
  - model of Gasgupta et al., 271–8
  - one-dimensional treatments of, 233–4
  - particle velocity profiles in, 277
  - volume fraction profiles in, 276
- riser flow, fully developed
  - boundary conditions for, 239–43
  - contours of pressure gradient for, 243–5, 246, 266–71, 286
  - ‘crossback’ interval in, 245
  - dimensionless variables for, 243
  - downflow of particles near pipe wall in, 246
  - flooding conditions for, 243
  - K- $\epsilon$  closure for time-averaged equations, 260–1
  - ‘laminar’ model of Sinclair & Jackson, 236–55
  - length scales associated with, 235
  - observations of distribution of particles in, 234–5, 270–1, 272–3, 283, 285
  - observations of pressure gradient in, 274–5
  - ‘pseudoturbulent’ model of Dasgupta et al., 256–71
  - ‘pseudoturbulent’ model of Hrenya & Sinclair, 278–87
  - radial profiles of velocities and solids fraction, 245–53
  - sensitivity to values of coefficients of restitution, 254–5, 280–2
  - time-averaged equations of motion for, 257–9
  - Zenz diagrams for, 234, 251, 254, 270, 271
- scales, separation of, 19
- scaling (for equations of motion)
  - difficulty of, 59
  - for fully developed one-dimensional waves, 187
  - for fully developed riser flow, 243
  - for stability of uniform fluidized bed, 106
  - for standpipe flow, 305
- shear cell, 66
- shock formation, 184, 196
- short relaxation time approximation, 56–9
  - condition for validity, 58
  - table illustrating range of validity, 58
- solitary waves, 199
- solitons, 199
- stability
  - analysis with pseudo-thermal energy balance, 142–4
  - conditions for uniformly fluidized state, 117–23, 147–50
  - criterion of Batchelor, 119
  - criterion of Foscolo & Gibilaro, 119
  - criterion of Wallis, 120
  - effect of distributor  $\Delta p$  and bed width on, 147–50
  - of flow in a vertical pipe, 10
  - of fully developed one-dimensional waves, 191, 194–6, 204
  - of fully developed two-dimensional waves, 205
  - of stratified fluid, 224–6
  - predictions for specific systems, 121–3
  - role of yield stress in, 144
- standpipe flow
  - aerated, 321–8
  - aeration point location, 327–9
  - alternative configurations for, 300
  - comparison of predictions with experiment, 316–18, 327–8
  - gas pressure profiles in, 302, 318–21
  - hysteresis in, 315–16, 326
  - matching conditions between sections, 310–11
  - motion in discharge device, 309–10
  - motion in feed hopper, 306–8
  - motion of packed bed in pipe, 308–9
  - motion of suspension in pipe, 309
  - predicted behaviour with aeration, 323–7
  - predicted behaviour without aeration, 313–16
  - regimes with aeration, 322–3
  - regimes without aeration, 312
- Stokes drag force, 35
- Stokes number, 33–4, 36, 38, 39, 40, 47
- stress tensor
  - closures in suspensions, *see* closures for averaged quantities
  - effective for fluid phase, definition, 26
  - effective for particle phase, definition, 26
  - point for fluid, 22
- terminal velocity, 5, 40, 49, 81, 185, 186, 244, 262
- traction on particle surface, 25
- ‘two fluid’ models, 3

*Subject Index*

339

- velocity fluctuations (in fluidization and defluidization), 95–6
- vertical pipe flow, 4–13
  - choking in, 9–10
  - determination of operating conditions for, 9
  - effect of wall stress on, 10–13
  - flooding in, 7
  - stability of, 10
- virtual mass force, 48
  - on isolated particle (Maxey & Riley), 53
  - Zhang & Prosperetti's expression for, 52
  - Zuber's expression for, 52
- volume fraction
  - fluctuation at large Stokes number (Buyevich), 40
  - fluid, definition, 20
  - solids, definition, 21
- wall friction, 80–1, 88, 308
- waves, one-dimensional
  - bifurcations of, 190–1
  - fully developed, 187–99
  - nonlinear treatments of, 183–99
  - stability against one-dimensional perturbations, 194–5
  - stability against two-dimensional perturbations, 199–203
  - time development of, 192–3
- waves, two-dimensional
  - and absence of bubbles from liquid fluidized beds, 216–19
  - bifurcations of, 204–5, 207–8, 210, 223–4
  - experimental evidence in liquid fluidized beds, 199
  - fully developed, in air fluidized bed, 203–7, 208, 209
  - fully developed in liquid fluidized bed, 207–8, 210, 211
  - growth from one-dimensional waves
    - in air fluidized bed, 208–210, 212, 213
    - in liquid fluidized bed, 216–18
  - growth from uniform air fluidized bed, 212, 214–15
  - growth from uniform liquid fluidized bed, 219
  - relation to bubbles in dense air-fluidized bed, 206–7, 210–12, 214
  - relation to clusters in dilute air-fluidized bed, 221–4
- yield conditions for fluidization-defluidization, 79
- yield loci, 72–5
- yield surfaces, 76
- Zenz diagram, 7, 11, 234, 251
