<i>Introduction</i>	<i>page xi</i>
1 The Black–Scholes Theory of Derivative Pricing	1
1.1 Market Model	1
1.1.1 Brownian Motion	2
1.1.2 Stochastic Integrals	3
1.1.3 Risky Asset Price Model	4
1.1.4 Itô’s Formula	6
1.1.5 Lognormal Risky Asset Price	8
1.2 Derivative Contracts	8
1.2.1 European Call and Put Options	9
1.2.2 American Options	10
1.2.3 Other Exotic Options	11
1.3 Replicating Strategies	12
1.3.1 Replicating Self-Financing Portfolios	12
1.3.2 The Black–Scholes Partial Differential Equation	13
1.3.3 Pricing to Hedge	15
1.3.4 The Black–Scholes Formula	15
1.4 Risk-Neutral Pricing	18
1.4.1 Equivalent Martingale Measure	19
1.4.2 Self-Financing Portfolios	20
1.4.3 Risk-Neutral Valuation	21
1.4.4 Using the Markov Property	22
1.5 Risk-Neutral Expectations and Partial Differential Equations	23
1.5.1 Infinitesimal Generators and Associated Martingales	24
1.5.2 Conditional Expectations and Parabolic Partial Differential Equations	25

vi	<i>Contents</i>
1.5.3	Application to the Black–Scholes Partial Differential Equation 26
1.5.4	American Options and Free Boundary Problems 27
1.5.5	Path-Dependent Derivatives 29
1.6	Complete Market 31
2	Introduction to Stochastic Volatility Models 33
2.1	Implied Volatility and the Smile Curve 34
2.1.1	Interpretation of the Smile Curve 35
2.1.2	What Data to Use 37
2.2	Implied Deterministic Volatility 38
2.2.1	Time-Dependent Volatility 38
2.2.2	Level-Dependent Volatility 39
2.2.3	Short-Time Tight Fit versus Long-Time Rough Fit 39
2.3	Stochastic Volatility Models 40
2.3.1	Mean-Reverting Stochastic Volatility Models 40
2.3.2	Stock-Price Distribution under Stochastic Volatility 42
2.4	Derivative Pricing 42
2.5	Pricing with Equivalent Martingale Measures 46
2.6	Implied Volatility as a Function of Moneyness 48
2.7	Market Price of Volatility Risk and Data 49
2.8	Special Case: Uncorrelated Volatility 51
2.8.1	Hull–White Formula 51
2.8.2	Stochastic Volatility Implies Smile 51
2.8.3	Remark on Correlated Volatility 53
2.9	Summary and Conclusions 55
3	Scales in Mean-Reverting Stochastic Volatility 58
3.1	Scaling in Simple Models 58
3.2	Models of Clustering 59
3.2.1	Example: Markov Chain 60
3.2.2	Example: Another Jump Process 64
3.2.3	Example: Ornstein–Uhlenbeck Process 67
3.2.4	Summary 70
3.3	Convergence to Black–Scholes under Fast Mean-Reverting Volatility 70
3.4	Scales in the Returns Process 71
3.4.1	The Returns Process 72

<i>Contents</i>	vii
3.4.2 Returns Process with Jump Volatility	72
3.4.3 Returns Process with OU Volatility	73
3.4.4 S&P 500 Returns Process	75
4 Tools for Estimating the Rate of Mean Reversion	77
4.1 Model and Data	77
4.1.1 Mean-Reverting Stochastic Volatility	77
4.1.2 Discrete Data	78
4.2 Variogram Analysis	79
4.2.1 Computation of the Variogram	79
4.2.2 Comparison and Sensitivity Analysis with Simulated Data	80
4.2.3 The Day Effect	83
4.3 Spectral Analysis	84
5 Asymptotics for Pricing European Derivatives	87
5.1 Preliminaries	87
5.1.1 The Rescaled Stochastic Volatility Model	88
5.1.2 The Rescaled Pricing Equation	88
5.1.3 The Operator Notation	89
5.2 The Formal Expansion	90
5.2.1 The Diverging Terms	90
5.2.2 Poisson Equations	91
5.2.3 The Zero-Order Term	93
5.2.4 The First Correction	94
5.2.5 Universal Market Group Parameters	96
5.2.6 Probabilistic Interpretation of the Source Term	97
5.2.7 Put–Call Parity	98
5.2.8 The Skew Effect	98
5.3 Implied Volatilities and Calibration	99
5.4 Accuracy of the Approximation	102
5.5 Region of Validity	104
6 Implementation and Stability	108
6.1 Step-by-Step Procedure	108
6.2 Comments about the Method	109
6.3 Dividends	112
6.4 The Second Correction	113

viii	<i>Contents</i>
7 Hedging Strategies	115
7.1 Black–Scholes Delta Hedging	115
7.1.1 The Strategy and Its Cost	116
7.1.2 Averaging Effect	117
7.2 Mean Self-Financing Hedging Strategy	119
7.3 Staying Close to the Price	121
8 Application to Exotic Derivatives	124
8.1 European Binary Options	124
8.2 Barrier Options	125
8.3 Asian Options	129
9 Application to American Derivatives	132
9.1 American Problem under Stochastic Volatility	132
9.2 Stochastic Volatility Correction for an American Put	133
9.2.1 Expansions	134
9.2.2 First Approximation	136
9.2.3 The Stochastic Volatility Correction	138
9.2.4 Uncorrelated Volatility	140
9.2.5 Probabilistic Representation	141
9.3 Numerical Computation	141
9.3.1 Solution of the Black–Scholes Problem	141
9.3.2 Computation of the Correction	142
10 Generalizations	145
10.1 Portfolio Optimization under Stochastic Volatility	145
10.1.1 Constant Volatility Merton Problem	145
10.1.2 Stochastic Volatility Merton Problem	147
10.1.3 A Practical Solution	151
10.2 Periodic Day Effect	153
10.3 Other Markovian Volatility Models	156
10.3.1 Markovian Jump Volatility Models	156
10.3.2 Pricing and Asymptotics	158
10.4 Martingale Approach	159
10.4.1 Main Argument	159
10.4.2 Decomposition Result	161
10.4.3 Comparison with the PDE Approach	164

<i>Contents</i>	ix
10.5 Non-Markovian Models of Volatility	165
10.5.1 Setting: An Example	165
10.5.2 Asymptotics in the Non-Markovian Case	166
10.6 Multidimensional Models	169
11 Applications to Interest-Rate Models	174
11.1 Bond Pricing in the Vasicek Model	174
11.1.1 Review of the Constant Volatility Vasicek Model	174
11.1.2 Stochastic Volatility Vasicek Models	177
11.2 Bond Option Pricing	182
11.2.1 The Constant Volatility Case	183
11.2.2 Correction for Stochastic Volatility	185
11.2.3 Implications	189
11.3 Asymptotics around the CIR Model	190
11.4 Illustration from Data	192
11.4.1 Variogram Analysis	192
11.4.2 Yield Curve Fitting	193
