

## Contents

<i>Preface</i>	<i>page vii</i>
1 The Boltzmann distribution law and statistical thermodynamics	1
1.1 Nature and aims of statistical mechanics	1
1.2 The Boltzmann distribution law	2
1.3 The partition function and statistical thermodynamics	6
2 The ideal gas	16
2.1 Boltzmann statistics	16
2.2 Translational partition function	21
2.3 Vibrational partition function	27
2.4 Rotational partition function; <i>ortho</i> - and <i>para</i> -hydrogen	31
2.5 The “law” of the equipartition of energies	41
2.6 Partition function with excited electronic states	43
3 Chemical equilibrium in ideal-gas mixtures	47
3.1 Thermodynamic preliminaries; the equilibrium constant	47
3.2 Equilibrium constants from partition functions	49
4 Ideal harmonic solid and black-body radiation	55
4.1 Ideal harmonic crystal	55
4.2 Rayleigh–Jeans law	57
4.3 Debye theory of the heat capacity of solids	62
4.4 Black-body radiation	66
5 The third law	69
5.1 Nernst heat theorem in thermodynamics	69
5.2 Third law in statistical mechanics	71
5.3 Comparison with experiment	75
6 The non-ideal gas	81
6.1 Virial coefficients	81
6.2 Intermolecular forces	83
6.3 Second virial coefficient from statistical mechanics	87
6.4 Long-range forces	98

Cambridge University Press

0521811198 - Statistical Mechanics: A Concise Introduction for Chemists

B. Widom

Table of Contents

[More information](#)

---

vi	<i>Contents</i>	
7	The liquid state	101
	7.1 Structure of liquids	101
	7.2 Equation of state of a liquid	106
	7.3 Computer simulation: molecular dynamics	114
	7.4 Computer simulation: Monte Carlo	127
8	Quantum ideal gases	133
	8.1 Bose–Einstein and Fermi–Dirac statistics versus Boltzmann statistics	133
	8.2 The grand-canonical partition function	138
	8.3 Grand partition function of the quantum ideal gases	143
	8.4 The ideal gas in Fermi–Dirac statistics	155
	8.5 The ideal gas in Bose–Einstein statistics	162
	<i>Index</i>	169
