 - asymptotic stationarity, 196–201
 - complement theorems and details, *See* Markov processes and complement theorems
 - construction of stochastic processes, 122–126
 - convergence of steady states for, on finite state spaces, 133–143
 - different states of Markov chain, 131–133
 - measurable state spaces, 176–185
 - metric spaces, 191–196
 - on polish space, 210–211
 - properties of Markov chains, 143–150
 - recurrence and steady state distributions of Markov Chains, 130, 151–176
 - skeleton, 277
 - stable in distribution, 248
 - stationary, 130
 - strong law of large numbers and central limit theorem, using, 185–191
 - supplementary exercises on, 239–245
 - transient and recurrent chains, 150–159
 - transition probability of, 119
 - unique invariant probability of, 252, 281–282, 344, 358–359
- Markov processes and complement theorems
- Alexandrov's theorem, 219–221
 - Ergodicity of Harris recurrent processes, 214–217
 - Feller's renewal theorem, 209–210
 - Finite dimensional weak convergence, 221–227
 - Kolmogorov distance theorem, 237–238
 - Prokhorov's theorem, 234–237
 - Scheffe's theorem, 228
 - Tychonoff's theorem, 227
- Markov property, 126, 128, 130, 203
- strong, 145, 173
- Markov renewal model, 412
- martingale difference sequence, 353
- matrix in triangular form, 307
- maximal solution of the system, 241–242
- maximum sustainable consumption, 25–26
- maximum sustainable harvest, 25
- maximum sustainable stock for technology, 61
- maximum theorem, 386–388
- mean value theorem, 8, 23, 43
- measurability, 323, 364
- change of variable, 428–430
 - product spaces, 426–428
 - subspaces, 426
 - support of a measure, 428
- measurable space, 176, 425
- metric spaces
- and diagonalization argument, 423–425
 - compactness, 422–423
 - completeness, 420
 - infinite products of, 423–425
 - nonempty compact, 7
 - separability, 420
- mild discounting, 30
- minimum safe standard of conservation, 32
- monetary equilibrium, 116–117
- monotone maps, 255, 257, 286, 322, 362, 389
- Multiplicative shocks, 266–267
- Newton's law of cooling, 170
- non-decreasing maps, 286, 288, 362
- non-increasing maps, 286
- nonautonomous systems, 19
- nonclassical optimization model, 28
- nonnegative definites, 123

- nonnegative matrix, 55, 58
 nonnegative random variables, 303, 323
 nonnegative real roots, 30
 nonnegativity constraints, 336–338
 nonrandom sequence, 370
- one-sector growth theory, 24
 optimal consumption policy function, 64, 74, 76
 optimal exploitation, of a fishery, 82–83
 optimal for discounted reward, 412
 optimal growth, in a productive economy, 74
 optimal investment policy function, 71, 74, 76
 optimal policy function, 380, 384
 optimal programs
 chaotic, 79–80
 long-run behavior of, 31
 periodic, 77–79
 qualitative behavior of, 30
 unique, 31, 62–64, 75
 optimal stationary programs, 60, 71–72
 optimal transition functions, 80
 optimization with wealth effects, 77–83
 orbit, from x , 4
 output program, 29, 61
- period-doubling bifurcation, 42
 to chaos, in an overlapping generations model, 115
 period-two orbit, 35
 periodic points, 12, 33
 basic definitions, 3–11
 hyperbolic, 8
 periodicity, 139
 permutation matrix, 53
 Perron–Frobenius operator, 55
 point process, 206
 Poisson equation, 352, 359, 363–364
 policy function, 96
 positive recurrent state, 176
 probability of survival, of economic agent, 339
 product sigmafield, 123
 product topology, 423
 production function, 24, 28, 94, 98
 Prokhorov metric, 236
 Prokhorov's theorem, 234–238, 276
 pure accumulation program, 30–31
- Q -uniformity class, 229
 quadratic maps, 310–317
 random iterations of, 367–369
 stable periodic orbits, 33–37
- Ramsey–Euler condition, 69, 71–72, 76–77, 401, 403–404, 406
 Ramsey–Weizsacker criterion, 111
 random continued fractions
 Bernoulli Innovation, 330–336
 compliment theorems and details, 342–349
 dynamical systems of Gauss, 324
 Euclid's algorithm, 324
 general continued fraction, 325–330
 model with multiplicative shocks and survival probability of an economic agent, 338–342
 nonnegativity constraints, 336–338
 random dynamical systems, 121, 191–192
 applications of, 262–275
 compliment theorems and details, 284–294
 contractions, 275–284
 evolution, 246–247
 of optimal inputs, 402–407
 role of uncertainty, 248–250
 splitting, 250–260
 supplementary exercises, 294–296
 random dynamical systems, special structures of
 compliment theorem and details, 342–399
 iterates of quadratic maps, 310–317
 iterates of real-valued affine maps, 297–304
 linear autoregressive models, 304–310
 random dynamical systems (*cont.*)
 multiplicative shocks model, 338–342
 NLAR (k) models, 317–323
 NLARCH (k) models, 317–323
 non negative constraints, 336–338
 other linear time series models, 304–310
 random contained fraction, *See* random continued fractions
 survival probability of an economic agent, 338–342
 random Lipschitz coefficients, 275
 recurrent chains, 120
 regeneration program, 31–32
