List of Contributors, ix

History of the British Ecological Society, xiii

Preface, xv

- 1 Introduction: why macroecology? 1
Tim M. Blackburn and Kevin J. Gaston

Part 1: Why are some taxa more diverse than others? 15

- 2 Evolutionary analysis of species richness patterns in aquatic beetles: why macroecology needs a historical perspective, 17
Alfried P. Vogler and Ignacio Ribera
- 3 The unified phenomenological theory of biodiversity, 31
Sean Nee

Part 2: Why are most species rare? 43

- 4 The neutral theory of biodiversity and biogeography, and beyond, 45
Stephen P. Hubbell and Jeffrey K. Lake
- 5 Breaking the stick in space: of niche models, metacommunities and patterns in the relative abundance of species, 64
Pablo A. Marquet, Juan E. Keymer and Hernán Cofré

Part 3: Why are there more species in the tropics? 85

- 6 How to reject the area hypothesis of latitudinal gradients, 87
Michael L. Rosenzweig
- 7 Climatic–energetic explanations of diversity: a macroscopic perspective, 107
Robert J. Whittaker, Katherine J. Willis and Richard Field
- 8 The importance of historical processes in global patterns of diversity, 130
Andrew Clarke and J. Alistair Crame

Cambridge University Press

0521839963 - Macroecology: Concepts and Consequences - The 43rd Annual Symposium of the British Ecological Society held at the University of Birmingham, 17-19 April 2002

Edited by Tim M. Blackburn and Kevin J. Gaston

CONTENTS

Part 4: Why are more species small-bodied? 153

- 9 Why are most species small-bodied? A phylogenetic view, 155

Andy Purvis, C. David L. Orme and Konrad Dolphin

- 10 Adaptive diversification of body size: the roles of physical constraint, energetics and natural selection, 174

Brian A. Maurer

Part 5: Why are some species more likely to become extinct? 193

- 11 Life histories and extinction risk, 195

John D. Reynolds

- 12 Routes to extinction, 218

Bernt-Erik Sæther and Steinar Engen

Part 6: Why are species not more widely distributed? 237

- 13 Why are species not more widely distributed? Physiological and environmental limits, 239

F. I. Woodward and C. K. Kelly

- 14 Macroecology and microecology: linking large-scale patterns of abundance to population processes, 256

Andrew R. Watkinson, Jennifer A. Gill and Robert P. Freckleton

- 15 Genetics and the boundaries of species' distributions, 274

Roger K. Butlin, Jon R. Bridle and Masakado Kawata

Part 7: Why are there interspecific allometries? 297

- 16 Intraspecific body size optimization produces interspecific allometries, 299

Jan Kozłowski, Marek Konarzewski and Adam T. Gawelczyk

- 17 Scaling the macroecological and evolutionary implications of size and metabolism within and across plant taxa, 321

Brian J. Enquist

Part 8: Why is macroecology important? 343

- 18 Macroecology and conservation biology, 345

Kevin J. Gaston and Tim M. Blackburn

- 19 Evolutionary macroecology and the fossil record, 368

David Jablonski, Kaustuv Roy and James W. Valentine

Cambridge University Press

0521839963 - Macroecology: Concepts and Consequences - The 43rd Annual Symposium of the British Ecological Society held at the University of Birmingham, 17-19 April 2002

Edited by Tim M. Blackburn and Kevin J. Gaston

CONTENTS

- 20 Comparative methods for adaptive radiations, 391
Robert P. Freckleton, Mark Pagel and Paul H. Harvey
- 21 The next step in macroecology: from general empirical patterns to universal ecological laws, 408
James H. Brown, James F. Gillooly, Geoffrey B. West and Van M. Savage
- Index, 425
