

Index

- alnico, 198
- amorphous materials, 153–166
- antiphase domain boundaries, 65
- asbestos, 176
- ASTM grain size, 1
- austenite, 58
- Avrami kinetics, 108–111

- Bloch walls, 191
- bonding, 133–142
 - covalent, 136
 - ionic, 133–134
- boundary layer, 94
- buckyballs, 180
- Burgers vector, 37

- carbon fibers, 180
- carburization, 80
- cementite, 57
- characteristic ratio, 155
- cholesteric liquid crystals, 168
- Clausius–Clapeyron equation, 57
- clay, 177
- columnar grains, 90
- columnar liquid crystals, 169
- constitutional supercooling, 95
- coordination, 136–139
- crystal structures, 140–142
- crystal systems, 11
- critical radius for nucleation, 86
- cube texture, 196
- Curie temperature, 66, 171, 191

- decarburization, 79
- dendrites, 90, 95–98
- devitrification, 162
- diamond, 179

- diffusion, 69–81
 - Darken's equation, 77
 - mechanisms, 73
 - multiphase systems, 78–81
 - self, 76
 - special paths, 76
 - temperature dependence, 75–76
- disclinations, 170
- dislocations, 36
 - energy, 38
 - stress fields, 38–39
 - partial, 39
- distribution coefficient, 92

- elastic moduli, 134
- enthalpy of mixing, 52
- entropy of mixing, 53
- error function, 71
- estimates, 214–215
- Euler relations, 6
- eutectic freezing, 98–100
- eutectoid transformation, 106–108
- exchange energy, 185

- ferromagnetism. *See* magnetism
- Fibonacci series, 16
- Fick's laws, 69–70
- foams, 202–204
- fractals, 17
- free energy, 52
- free energy curves, 55–56
- free volume, 154
- freezing
 - cellular growth, 96
 - growth, 89
 - segregation, 91–93
 - single crystal growth, 98

236 INDEX

- freezing (*cont.*)
 steady state, 95
 volume change, 85
 Frenkel defects, 34
 fullerenes, 180
- gas porosity, 98
 gas solubility, 98
 Gibbs free energy. *See* free energy
 Gibbs, Willard, 49
 grain boundaries, 125–127
 area per volume, 3
 wetting, 130
 grain size, 1–3
 ASTM, 1
 linear intercept, 1
 glass
 bridging oxygens, 158
 chalcogenide, 163–166
 compositions, 158
 delayed fracture, 163
 devitrification, 162
 inorganic, 157–166
 metal, 164–166
 silicate, 157
 thermal expansion, 161
 viscosity, 159
 Vycor, 161
 glass transition, 153–166
 polymers, 154
 golden ratio, 16
 Goss texture, 196
 grain boundary, low-angle, 39
 graphite, 179
 graphical differentiation and integration,
 224–226
 Greek alphabet, 231
 growth, freezing, 89
 growth of precipitates, 111–113
- hard sphere model, 155
 honeycomb structures, 204
 hot isostatic pressing, 151
- ice, 49, 57, 61
 icosahedron, 16
 interpolation and extrapolation, 228
 interstitials, 33
 invariant reactions, 44
 ionic radii, 139–140
 isothermal transformation diagrams,
 108
 iterative solutions, 226–227
- Johnson and Mehl equation, 108
- Kelvin, Lord, 8
 Kirkendall effect, 74–75
- Le Chatelier's principle, 57
 liquid crystals, 168–174
 displays, 174
 orientation parameter, 169
 optical response, 173
 phase changes, 172
 temperature and composition effects, 171
- lodestone, 184
 log-log and semi-log plots, 222
 logarithms and exponents, 230–231
 lyotropic liquid crystals, 171
- magnetic materials, 184–201
B-H curve, 190
 hard, 197–198
 oxides, 192
 soft, 194–196
 square loop, 199
 magnetic units, 189
 magneto-crystalline energy, 188
 magnetostatic energy, 187
 magnetostriction, 189
 martensitic transformations, 114–116
 melting points, 134
 metal glasses, 164–166
 metastability, 57
 mica, 176
 microstructural relations, 5–6
 Miller–Bravais indices, 21–23
 molecular length, 154–155
- nanotubes, 181
 negative thermal expansion, 205
 negative Poisson's ratio, 205
 nematic liquid crystals, 168, 174
 nucleation
 homogeneous, 85–88
 heterogeneous, 88–89
 solid state, 104
- order, 64–67
 long range, 64–67
 short range, 67
 Ostwald ripening, 113
- Pauling, Linus, 142
 pearlite, 107
 percent changes, 221

INDEX

237

- peritectic freezing, 100
 Pfann, William, 93
 phase rule, 43–44
 plasticizers, 154
 point defects, 33–36
 porous materials, 202–204
 precipitation-free zones, 113
 precipitates
 transition, 113
 growth, 111–112
 pressure effects, 57
- quartz, 178
 quasicrystals, 14–17
- ratios, 220
 radii ratios, critical, 136–138
- Scheil equation, 91
 Shottky defects, 34
 segregation to surfaces, 127
 segregation during freezing, 91–93
 significant figures, 229–230
 shape memory, 208–213
 silicates, 176–178
 silicon iron, 195
 sintering, 144–151
 activated, 150
 early stages, 146
 final stage, 147
 intermediate stage, 147
 liquid-phase, 150
 mechanisms, 144
 sketches, 215–217
 slopes, 221–222
 smectic liquid crystals,
 168
- solidification. *See* freezing
 solubility limits, extrapolation, 60
 space lattices, 11
 spinodal reactions, 116–118
 spherical triangles, 31
 stacking faults, 39
 steric parameter, 155
 stereographic projection, 26–30
 superelasticity, 209
 surfaces, 121–131
 surface energy
 amorphous materials, 125
 direct measurement, 128–129
 magnitudes, 131
 relation to bonding, 121
 relative, 129
 orientation dependence, 122–124
- ternary phase diagrams, 44–49
 tetrakaidecahedron, 6–8
 thermal shock, 160–161
 transformations, 104–119
- units, 217–219
- vacancies, 33
 volume fraction phases, 4
 Voroni cells, 157
- wetting, grain boundaries, 130
 Wigner–Seitz cells, 157
 whiskers, 40
 wulff plot, 123–124
- Zachariasen’s rules, 157
 zeolites, 182
 zone refining, 93
