Dry Valleys region, Antarctica, 800
ductile deformation, 428
at tip of dike, 82
Duluth Gabbro (see lopolith)
dunitite, 44
definition, 141
in layered intrusions, 385
veins in ophiolite, 44, 372, 373
Dutchess County, New York State, 87
eastern North America igneous province, 52 (see also large igneous provinces – LIP)
East Pacific Rise:
  axial magma chamber, 368
depth of melting beneath, 367
heat flux, 8
MELT Seismic Team, 367
eclogite (see metamorphic facies)
formation in sinking mantle plumes, 368
formation in subducting slabs, 590, 598
formation of immiscible carbonate melt in partially melted, 344
near-eutectic composition, 602
nodules (xenoliths) in kimberlite, 395, 602
Einstein limit, 23
element mobility, metamorphism (see mass transfer, metamorphic fluids)
element:
egraphite, 199
electron capture, 11, 296
elastic modulus, 95
Einstein limit, 23
Siderophile, 302
major, minor, and trace, 132
epidote, photomicrograph, 421
endothermic process (+)
endothermic reaction
enthalpy (see also internal, heat)
egradient, 137
enthalpy of formation, 100
enthalpy of fusion, 100
enthalpy of sublimation, 100
enthalpy of vaporization, 100
enthalpy of zeroth law of thermodynamics, 164
error function (erf), 114
error function (of), 114
eruption velocity (see velocity)
ephedra crystals, 272 (see also crystalloblastic series)
epicenter anomaly, 359, 361
in quartz megacrysts associated with massif-type anorthis, 403
in massif-type anorthises, 404
lack of, in continental flood basalts, 382
lack of, in MORB, 367
eutaxitic (see texture)
eutaxitic:
  composition and common igneous rocks, 199
  in binary system, 197
  intergrowths, 199
  graphic granite, 199, 200, 202
  ophiolitic, 198, 199
  in ternary systems, 217
exhumation (see also pressure−temperature−time paths)
  rates 567, 572, 577
exothermic process (−ΔH), 152
exsolution:
  epidote, 302
  intergrowths, 199
  spinel, 198
  spinel, 199, 200, 202
exchange reaction, 190
extinctive
  composition and common igneous rocks, 199
  in binary system, 197
  intergrowths, 199
  graphic granite, 199, 200, 202
  ophiolitic, 198, 199
  in ternary systems, 217
facies, metamorphic (see metamorphic facies)
  fault gouge, 441
  feldspar phase relations (see phase diagrams)
  felsic, 133, 137
  Fen district, Norway (carbonatite), 396
  fertilization (Na metasomatism), 347, 397
  Fenner fractionation trend, 403
  Ferrar, Antarctica, diabase sill, 83 (see also flood basalts)
  flamine (see texture, igneous
  Fick's first law, 39, 124 (see also mass transfer, metamorphic fluids, diffusion)
  crystal growth rate determined by, 271
  homogenization commingled magmas, 354
  Fick's second law, 124, 354 (see also mass transfer, metamorphic fluids, diffusion)
  filter pressing (see magmatic processes)
  fissure, 572, 303
  flaser gneiss, 441
  flinty-crush-rock, 442
  flood basalts, 52–59, 380–384
  Afar, Ethiopia, 381
  Antrim, Northern Ireland, 59
  aphyric nature of, 383
  associated with breakup of Pangea, 381
  association with continental rifting, 380
  association with mantle plumes, 380
  association with red bed sedimentary rocks, 380
  Columbia River, Washington and Oregon, 381 (see also Columbia River flood basalts)
  columnar jointing in, 55–57
  composition of, 381–382
  triparte division, 382
  Coppermine River, Northwest Territories, Canada, 388
  Deccan traps, India, 381 (see also Deccan trap)
  eastern North America and Morocco, 381
  Ferrar, Antarctica and Tasmania, 381
  Karoo, South Africa, 381
  gaseous emanations from, and effects on global climate and mass extinctions, 384
  inflation of flows, 53
  isotopic composition
  in δ24S–δ34S plots, 308, 309
  Keweenaw, Lake Superior, 381
  Greenland, Michigan, 57
  volume of, 52
  North Mountain basalt, Nova Scotia, vesicle cylinders in, 59
  Parana, Brazil, 381
  parental magma to, 382
  rare earth element concentration in, 381
 Snake River, Oregon and Idaho, 381
  Thulean, UK and Greenland, 381
  volume of, 52–53
  Zig-Zag Dal, northeastern Greenland, 380
  flow (see also flux, fluid flow, metamorphic):
  alignment of phenocrysts by, 49, 85
  average laminar velocity in dke, 38
  average laminar velocity in pipe, 37
  average turbulent velocity in dke, 41
  average turbulent velocity in lava flow, 38
  channel, 43–45
  in compacting crystal mush, 326
  in Oman ophiolite, 44
  channelized by deformation, 44–45, 601, 608
  choked (overpressured), 93
  diapiric, 45–47
  differentiation (see magmatic processes)
  focused, 44
  friction coefficient, 41
  igneous textural evidence of, 48–49
  laminar, 24, 37
  minimum, required for intrusion of sheet, 84
  plug flow of Bingham liquid, 40
  porous, 41–43
  shear induced, 45
  steady state flow in vertical pipe, 36–38
  steady state flow of lava, 25–26
  rate of basaltic magma at Pali-Aike, Chile, 28, 129
  rate of Bingham liquid, 39–41
  rate of kimberlite magma, 28
  rate of magma at convergent plate boundaries, 598
  rate of Newtonian magma, 35–39
  turbulent, 24, 37, 41
  in ash flows, 77
  viscous pressure drop, 31, 39
  flowage differentiation (see magmatic processes)
  fluid content, metamorphic protoliths, 415–416
  fluid flow, metamorphic (see also fluids, metamorphic; mass transfer, metamorphic fluids):
  across-layer inflation, 529, 530, 540–544
  advection, 511
  channel (flow in model fracture), 515
  convection, 516

composition, 399
crustal contamination of, 348, 400
definition, 141, 399
depth of source, 400, 606
in Archean greenstone belts, 399
in Caribbean, 399
liquidus temperature, 399
magma viscosity, 24
nickel sulfide deposit (Kambalda, Western Australia) associated with, 400
of Munro Township, Ontario, 273, 399
rare earth element(see Earth)
crystal, 13 (see Al2SiO5 polymorphs) to andalusite reaction, 167
laccolith, 93–95
Henry Mountains, Utah, 94
terminations on, 95
Maverick Mountain, west Texas, 93
peripheral shape of, 94
radius–depth relation, 94
radius–thickness relation, 95
lahar, 68
Mount Hood, Oregon, 69
Lakagigar fissure eruption (see Iceland)
Lake St. John, Quebec, anorthosite, 434 (see also anorthosite, massif-type)
laminar flow, 24
lamproite, 396
lamprophyres:
alkaline lamprophyres, 394–395
alnöite, 394
camptonite, 292, 394
classification, 139, 143
monchiquite, 394
laminite, 70
lithostatic pressure gradient, 3
lineation, 430
law of sines, 288
layer-parallel fluid flow, 516, 529, 530, 543
layered intrusion (see also fluid flow, metamorphism)
lithosphere, 3
locative reaction, 29
lithophile elements, 305
in carbonatite, 343
sulfide–silicate liquids, 248, 344
in core formation, 585
in gabbro, Sudbury, Ontario, 249
in komatite, Kambalda, Western Australia, 400
in Merensky Reef, Bushveld Complex, South Africa, 388
in mesotaxis of Hōoloe basalt, Connecticut, 249
in tholeiitic basalts, 291
liquidus, 119, 195
law of sines, 288
in Kilauea basaltic glass, 205, 206, 341
in anorthosite
in alkaline basalts, 342
in eclogite, 344
in mantle, 342
in anorthosite–quartz mangerite series, 403
in experimentally melted carbonated eclogite, 344
in Kilauea basaltic glass, 205, 206, 341
in layered intrusions, 385
in lunar samples, 340
in MORB, 367
in simple binary systems, 205–207
in layered ultramafic rocks, 387
in system fayalite–leucite–silica, 223
in ternary systems, 223–224
role in formation of carbonatite, 343
sulfide–silicate liquids, 248, 344
in core formation, 585
in gabbro, Sudbury, Ontario, 249
in komatite, Kambalda, Western Australia, 400
in Merensky Reef, Bushveld Complex, South Africa, 388
in mesotaxis of Hōoloe basalt, Connecticut, 249
in tholeiitic basalts, 291
liquidus, 119, 195
function of Δ T of fusion, 195
lithophile elements, 305
lithosphere, 3
extension and deformation melting, 593, 594
section through, 3
thickness of, 13
control on partial melting above Benioff zone, 377
in Archean, 378
lithostatic pressure gradient, 5, 515
local equilbrium, 523
Loch Ba ring dike, Mull, Scotland (see dikes)
lofítheith (layered intrusions), 95–99, 384–390 (see also Skæggaard)
age of large, 384
Bjerkreim–Sokkadal Intrusion, Norway, 350
anorthosite block in, 97
rhythmic layer and channels in, 97
Bushveld Complex, South Africa, 96, 384, 387–388
age of, 384
chromite layers, Dwars River, 385
layered ultramafic rocks, 387
magma mixing, 388
Main Zone, 388
Merensky Reef (chromite), 387, 388
possible meteorite impact origin of, 411
Upper Zone, 388
composition of magma, 384
multiple surges of fresh magma, 385
Dalholt gabbro: age of, 384
association with midcontinent gravity high, 381
Foteng–Hyllingren Intrusion, Norway, 350
Great Dyke of Zimbabwe (Rhodesia), 81, 97, 384
age of, 384
pyroxene and plagioclase cumulates, 332
lutetium (layered intrusion) (cont.)
Haukvik Intrusion, Norway, 350
isotopic evidence of crustal contamination of, 310, 350
Kalka Intrusion, central Australia, 310
Kiglapait, Labrador:
age of, 384
isotopic evidence of assimilation and fractional crystallization, 350
layering, 96, 333
layering of rocks in, 96, 97, 333
graded layers, 97
Musket Intrusion, Northwest Territories, Canada, 96, 384, 388–390
age of, 384
compaction of crustal mush in, 339
cyclic units in, 389
feeder dike to, 81, 97
Ram Complex, northwestern Scotland, 98
deformed layers of troctolite, 98
harrsitic texture, 98, 333
layered ultrabasic rocks on Hallival, 96
sequence of crystallization in, 385
Stavanger, Norway, 335
graded layering, 99, 334
Stillwater Complex, Montana, 97
age of, 384
chromitite layer, 96
doublet layering, 337, 338
inch scale layering, 337
magnatic lineation, 98
olivine–orthopyroxene reaction texture, 203, 222
poikilitic texture, 339
reaction texture, 338
sulphide (PGE) deposit, 346
Sudbury, Ontario, 97, 384, 410
age of, 384
breccia, 410, 411
crystal size distribution in, 285
immiscible sulfide ore in gabbro, 249
magmatic sulfide deposits, 248, 410
meteorite impact origin of, 410
typical rock types in, 385
Lord Kelvin, 6
low-T, high-p metamorphism, 4, 14 (see metamorphic facies series)
age of, 584
low-velocity zone (an hombre), 3, 7, 13
intersection of geotherm with garnet herzolite solidus, 591
melting in, 261
luteum:
$^{176}$Lu decay to $^{176}$Hf, 303
$^{176}$Lu–$^{176}$Hf and provenance of magma, 311
maar, 89, 90
mafic, 133, 137
magma, 19
accumulation in source, 599–601
ascent rate at convergent plate margins, 598 (see also flow)
assimilation (see assimilation)
bulk density of vesicular, 33
buoyant rise, 15, 28–32, 83
in batholiths, 102
chamber, 62
cooling rate of convecting and nonconveetcing, 324, 325
chamber, axial (AMC), 50
compressibility, 30
contamination (see assimilation)
crystal mush, 20
density, 21–23
role in magma mixing, 351
density increase with pressure, 23
depth to source, 31
derived from crust, $^{146}$Nd/$^{144}$Nd and $^{87}$Sr/$^{86}$Sr signature, 306
derived from depleted mantle $^{146}$Nd/$^{144}$Nd and $^{87}$Sr/$^{86}$Sr signature, 306
Lorraine
diapirc intrusion of, 45–47
differentiated – evolved, 42
direct measurement of temperature of, 19
disruption by expanding vesicles, 34, 69
flow rate of Bingham, 39–41
flow rate of turbulent, 41 (see also flow)
flow textures, 48–49
flow through channels, 16
flow through pores, 16
flux through pipe, 37
fool’s gold, 44
gases (see volcanic gases)
solubility (see water; carbon dioxide and sulfur)
generation, 599–601
intrusion, 28
intrusion rate of laminar Newtonian magma, 35–39
intrusion rate of turbulent magma, 41
level of neutral buoyancy, 31, 47
melting range, 19
mixing, 219, 350–356
cause of eruption, 377
com mingling, 351, 352–354, 377
effect on phase relations, 356
evidence from crystal size distribution, 285
evidence from phenocrysts, 355
formation of economic deposits, 356, 385
in anodesite, 377
in Bushveld Complex, South Africa, 388
in calcalkali series (BADR), 379
in dacite and rhyolite, 377
in andesites, 377
formation of economic deposits, 356, 385
in MORBs, 367
in Mount Desert Island, Maine, 353
isotopic evidence of, 309, 349, 355
Paricutin Volcano, Mexico, 355
Rayleigh number for, 351
role of magma density, 351
Reynolds number for, 351
Soret diffusion, 316, 345
solidification of, 591
parental, 316
primary, 316
rise by ballooning, 47
source region composition for basaltic magma, 601–604
based on mantle xenoliths, 601–604
pyrolyte model mantle, 604
steady-state laminar flow in vertical pipe, 36–38
superheat, 20, 115, 200
suspension, 20
tectonic pressure on, 35
temperature lowered by H$_2$O, 20
temperatures, 19–20
turbulent flux through dike, 41
turbulence, 33
viscosity, 16, 23–25 (see also viscosity)
role in magma mixing, 352
yield strength, 23, 317
maganatic processes, 316–364
assimilation (see assimilation)
compaction (see crystal-mush compaction)
convection, 317, 323–328
computation, 323, 325
double-diffusive, 326, 328
dripping instabilities, 328
forced, 323
free, 323
Nusselt number, 324
dense crystal suspensions, 328
rate near vertical wall, 323
rate of in sheet-like body cooled from
above, 325
Rayleigh number, 324
thermal, 323
turbulent flux through, 326
crystal-mush compaction, 328–331
in CoHassett, Columbia River, flood-basalt flow, 331
in Holyoke flood-basalt flow, Connecticut, 329–331
IRIDUIM program for modeling, 331
crystal settling, 317, 321–323
in ocellus, 343
Stokes law, 322–323
yield strength, 322
differentiation, 316
calculation using least squares computer fit to rock analyses, 321
rate determined using short-lived radiotopes, 379–380
filter pressing, 317, 340 (see also compaction)
flowage differentiation, 317, 340
fractionation:
Berthollet–Nemst (equilibrium), 358
crystal–liquid, 316
liquid, 316
Rayleigh, 358
liquid immiscibility, 316, 340–345
mel productivity under adiabatic decompression, 238
mixing (see magma mixing)
pneumatic action, 317, 346–347
resurgent boiling (second boiling), 259, 346
Soret diffusion, 316, 345–346
trace element fractionation, 356–361
during partial melting in source region, 601
vapor-phase separation (see pneumatic action)
zone melting, 349
magmam, 601
magnesium number M$_r$ (differentiation index), 318
of MORB, 367
magnetic field, 2, 326
magnete:
crystallization, effect on vanadium content of magma, 359
skelatal form of, 273
with fayalite and quartz as oxygen buffer (see oxygen)
with ilmenite as oxygen buffer (see oxygen)
major element, 132
mantle of Earth, 2
array in cca-εq plot, 308
composition, 131
density, 29
depleted, 309
rare earth element signature of, 361
fertile, from Kilbourne Hole, New Mexico, 603
isotopic signature of magma sources in, 312
depleted MORB mantle (DMM), 312
enriched mantle I (EM I), 312
enriched mantle II (EM II), 312
focus zone (FOZO), 312
high μ (HIMU), 312
layered (upper, lower), 588–589
metamatosis, isotopic evidence for, 311
prior to ocean island magmatism, 593, 594, 631
nODULES (see mantle xenoliths)
plume, 52, 368
association with large igneous provinces (LIP), 368
association with alkaline igneous rocks, 367
beneath:
Afar triangle, Ethiopia, 392
Hawaii, 365, 589
Iceland, 365, 381, 580
depth of origin, 365
diameter of plume head, 368

dressed as H2 and He, 369
excess temperature, 368
flood basalts associated with, 380
isotopic signature, 309, 312
superplume, 589
thermochemical, 368
pyrolite, model, 604
tensile strength of upper, 32
time of formation based on 44Nd/144Nd in, 305
viscosity of, 23, 26
wedge above subduction zone, 310–311

temperature distribution in, 596
xenoliths:
eclogite, 602
in alkaline rocks, 601–604
in anolite, 395
in duitremes (kimberlite), 93
in kimberlite, 395
in ocean island nephelinites, 370
peridotinites (garnet lherzolite, spinel lherzolite, harzburgite), 602
marble, 494 (see also metacarbonate rock)
Margules’ formulation (asymmetric regular solution model), 187
Marx:
Olympus Mons, 66
volcanoes on, 66
mass balance analysis (see mass transfer, metamorphic fluids)
metamorphic fluids (see also fluid flow, metamorphic):
advection of mass, 516, 526
conservation of mass:
advection-hydrodynamic dispersion, 526
advection-hydrodynamic dispersion-reaction, general form, 528
advection-hydrodynamic dispersion-reaction, with kinetics, 539–540
solution to partial differential equation, example, 527
diffusion, 511, 517, 518
cross coefficients, 524
Fick’s first law, 517
Fick’s second law, 518
interdiffusion coefficients, 524
lense scales, 518, 543
Onsager diffusion coefficients, 524
fluxes (see time-integrated fluid flux)
H2O–CO2 transport-reaction across lithologic contacts, 540–544
hydrodynamic dispersion, 518, 526, 540
large ion lophiolite elements (LILE), 544
mechanical dispersion, 518
metasomatic zonation, 522–525, 544
metasomatism, examples of element mass transfer:
chert nodules, 522–525
mélange zones, 544
subduction zones, general, 544
vein selvages, 550–555 (see also veins, metamorphic)
metasomatism, mass balance analysis of:
concentration ratio (CR) diagram, 553
interpretation of elemental ratios, 550–551
interpretation of mass and volume changes, 553
mass change, overall for rock, 552
mass changes for individual elements, 552
partial melting, 552
precursor rock, 550
pseudomorphs and volume change, 551
residual framework, 551
residual dilution, 554
statistical treatment, 553–554
volume change for rock, 552
wedge diagram, 544, 555
rare earth element (REE) mobility, 553
Mauna Loa, Hawaii (see volcanoes)
mean free path (see diffusion)
mechanical dispersion (see mass transfer, metamorphic fluids)
Melford dike, Massachusetts, 85
mélange zones, 544
melanoseric, 137
melanosene, 44
melting (see also partial melting)
beginning of melting curves (H2O-saturated) for common minerals and rocks, 251, 252
convect, 28, 580
decompression, 15, 236–239 (see also adiabatic)
fluxing with H2O, 15, 17
hydrous mineral, 254
incongruent melting, 201
productivity resulting from adiabatic decompression, 238 (see also adiabatic)
range of igneous rocks, 19
temperature lowered by H2O, 20, 250–254
volume expansion on, 22, 32
zone, 349
MELTS, 194, 239–240
density calculation, 22
viscosity calculation, 23
use in normative mineral calculation, 136–137, 148
MELTSeismic Team (East Pacific Rise), 367
Merrimack synclinorium, Massachusetts and Connecticut, 481, 485–486, 578
mesosome (see igneous cumulates)
metabasalt:
ACF diagrams for, 455
blocks in mélange zones, 544
metamorphic facies, 419–424
petrography of, 423
pseudosection example, 489
metacarbonate rock:
calsicarbonate, 494
common reactions, 495, 499–501, 506, 541
contact metamorphism, 494
fluids (see fluids, metamorphic; mass transfer, metamorphic fluids; time-integrated fluid flux)
H2O–CO2 transport-reaction across lithologic contacts, 540–544
index mineral zones, contact metamorphism example, 495
index mineral zones, regional metamorphism example, 541
metasomatism and mass transfer, 522–525, 540–544, 550–555
petrogenetic grid (see T-XcO2 diagram)
petrography of, 541
petrologic characteristics, 490
vein selvage metamassotomism, 550–555
metamorphic core complex, 573
metamorphic facies, 419–424, 455
albite–epidote hornfels, 422
amphibolite, 422
blueschist, 422
eclogite, 422
granulite, 422
greenschist, 422
hornblende hornfels, 422
prehnite–pumpellyite, 422
pumpellyite–actinolite, 422
pyroxene hornfels, 422
sandinite, 422
zoilite facies, 422
metamorphic facies series, 562
high-temperature, high-pressure (Bachan, Abukuma) type, 417, 470, 485, 562, 568, 579–580
intermediate, 562
low-temperature, high-pressure (LT/HP) type, 562, 569, 575–587
moderate-temperature, moderate-pressure (Barrovian) type, 417, 486, 562, 572, 580
metamorphic field gradient, 562, 563
metamorphic geotherm, 562
metamorphic grade, 417
metamorphic mineral facies, 419, 451
metamorphic rocks, 1, 14
crustal volume of, 414
mapping of, 417–419
model terrane map and interpretation, 447–454
metamorphic reaction overstepping, 270, 293 (see also kinetics of metamorphic reactions)
metamorphic subfacies, 424
metamorphic textures (see texture; metamorphic metamorphism:
Barrovian, 417 (see also Scottish Highlands for more detail)
Buchan, 417 (see also high-T, low-P metamorphism)
contact, 1, 14, 414, 427
marble at contact with dike, Montreal, Quebec, 82
nucleation rate of garnet near dike, County Mayo, Ireland, 270
result of advective transfer from mantle by magma, 594
definition, 414
facies series (see metamorphic facies series) high-T, low-P metamorphism, 4, 258 (see also metamorphic facies series)
high-T, high-P metamorphism, 4 (see also metamorphic facies series)
low-T, high-P metamorphism, 4, 14 (see also metamorphic facies series)
partial melting and, 448, 453–454
prograde, 414, 474–454
regional, 1, 14, 17, 414
due to heat advectively introduced by magma into crust, 598
low-grade, due to lithospheric extension, 594
retrograde, 414, 417
preservation of mineral assemblages during exhumation, 560–562
seafloor hydrothermal, 414, 422, 424, 516
ultrahigh pressure (UHP), 425, 459
ultrahigh temperature (UHT), 425
age of, 584
formed after removal of melt, 599
metapelite (see also Scottish Highlands):
AFM diagram (Thompson projection), 457–462
common mineral formulas, 457
components in, 459
petrogetic grid, 467–469
petrography of, 468
protolith (shale) composition, 457
pseudosection example, 482–485
solid solutions, 457–467
thermobarometry (see thermobarometry) variance of assemblages, 458, 460
metasomatism (see also mass transfer, metamorphic fluids, replacement):
dike emplacement by, 85
fertilization, 347
of mantle (see mantle, metasomatism)
sodium (on ocean floor), 139
metastable (see also stability):
reaction, 425, 560
Meteor Crater, Arizona (see meteorite)
meteors, 130–132
chondrule, 132
flux as function of time, 405
from Mars, 132
from Moon, 132
kinetic energy of, 405
impact-generated rocks and minerals, 405–411
breccia, 406, 411
coesite, 409
diamond, 407, 410
lechatelierite, 407
melt, 406, 407, 411
maskelynite, 407, 408
Onaping tuff, Sudbury (fall back breccia), 411
planar features in quartz, 408
pseudotachylyte, 409, 410, 411
shatter cones, 406, 407
stishovite, 409
Sudbury breccia, 411
tekites, 407
impact (explosion) structures, 409
central uplift, 406
Bushveld Complex, South Africa, 411
Charlevoix, Quebec, 407
Chichuahua, Yucatan, Mexico, 408, 409
Clearwater Lakes, Quebec, 408
crater diameter as function of kinetic energy, 406
craters, 405, 406
decompression melting associated with, 409
greenstone belts, 398
large Precambrian layered intrusions, 384
Manicouagan, Quebec, 407, 408, 409
Meteor Crater, Arizona, 406
shatter cones, 406, 407
Sudbury impact, Ontario, 410
Vredfedorf, South Africa, 408
iron, 131, 132
stony, 131
achondrites, 131
chondrites, 11, 131, 132
accretion following core formation, 304
carbonaceous, 131
eucrite, 131
ordinary, 131
stony iron, 131, 132
velocity, 405
mariote, 103, 259
Mid-Atlantic Ridge:
Iceland, 53, 54
textural variation across pillow from, 273
midcontinent gravity high, 381, 405
Midland Valley of Scotland, alkaline rocks associated with, 391
mid-ocean ridge (see also Pacific Ridge; Mid-Atlantic Ridge):
axial magma chamber (AMC), 50
basalt (MORB) (see MORB)
fracture erosion, 405
volume of, 52
fracture zone, 366
heat flux, 4, 8
potential temperature, 366
shallow thermal anomaly in mantle, 589
migmatite, 44, 45, 252, 414, 448, 608 (see also partial melting)
lucosomite, 44
melanosome, 44
Milankovitch cycles (see oxygen isotopes)
Minas Gerais, Brazil, carbonatite, 396
minerals:
accessory, 19, 133
rock-forming and accessory, 19, 133
minimum (on liquidus), 212, 227
minor element, 132
mode, 133
determination by point counting, 133
determination from image analysis, 133 (see also National Institutes of Health (NIH) Image)
modified Redlich-Kwong equation, 246, 491
Mohorovičić discontinuity (Moho, M), 2, 370
in ophiolite, 373
mineral transformations at, 17
mobility, definition of, 520
molar volume, 22
partial, 21
mole fraction, 22
monazite:
absolute dating of, by electron microprobe analysis, 303
closure temperature of, 303
zoning in, 303
monchique, 394
Montenegrin igneous province, southern Quebec, 101
alkaline rock distribution, 392–393
assimilation in, 347
bimodal (mafic–felsic) composition of rocks in, 343
possible role of liquid immiscibility, 393
Daily Gap in rock series, 393
diabase breccia, Ile Bizard, 90
dikes and sills, 82
isotopic evidence for crustal contamination of mantle-derived magma, 307
layering in gabbros, 337
Oka carbonatite, 396
Rb–Sr isochron, 299
Moon:
anorthosite in lunar highlands, 400
formation from giant impact on Earth, 10, 304
age of, 304
liquid immiscibility in lunar rocks, 340
maria basalt, 398
rise of basaltic magma on, 31
MORB (mid-ocean ridge basalt), 366–368
classification on basis of isotopic signatures, 148
depleted source of, 367
depth of source, 367, 605, 607
fractionate, 367
role of augite in, 367
immiscible glasses in, 367
isotopic composition of, 311–312
in Nd–Sr, Sr plot, 308
magma mixing, 367
magnesium number of, 367
N-type, 312
phenoocrysts of olivine and plagioclase in, 366
product of depressional melting, 594
rare earth element concentration in, 361
Soret diffusion in, 345
volume of, 53
Mount Desert Island, Maine, basalt inclusions in granite, 105
Mount Johnson, Quebec, layering in, 337
Mount Pelée, Martinique (see volcanoes)
Mount Royal, Montreal, Quebec, dike bridges and horns, 86
Mount St. Helens, Washington State, 28, 67, 69, 73, 74
explosion velocity, 28
zoned plagioclase phenocryst in andesite, 376
Mounts granite, Northern Ireland, 89 (see also dike, ring)
mudflows (volcanic), 68 (see lahars)
null, Isle of, Scotland: cone sheet, 88
isotopic composition of basalt from, 309
$^{18}O$ around central complex, 313
Loch Ba ring dike, 109
muscovite (see dehydration reaction)
Muskox Intrusion, Northwest Territories, Canada (see lopolith)
mylonite, 442
grain size of, 271
National Institutes of Health (NIH) Image program, 108, 133
use in measuring mode, 148
skeletonize function in, 330
use in measuring mode, 148
natrocarbonatite (Na$_2$CO$_3$), Oldsinyo Lengai, Tanzania, 392
Naxos, Greece, 573
donutymumum: $\varepsilon$Nd, 308
$^{143}$Nd/$^{144}$Nd evidence of crustal contamination, 349
$^{143}$Nd/$^{144}$Nd evolution in bulk Earth, 305–306
$^{143}$Nd/$^{144}$Nd evolution in crust, 306
$^{143}$Nd/$^{144}$Nd evolution in mantle, 306
$^{143}$Nd/$^{144}$Nd in MORB, 306
$^{143}$Nd/$^{144}$Nd in primordial Earth, 305
nepheline:
monzonite dikes, 46
phenocrysts, 200
nuclei, eutectic composition of, 202
nepheline, overstepping required for, 268, 269
overheating (metamorphic), 270
strain, 271
undercooling (igneous), 270
nuclei (see nucleation)
muñez ardentés (glowing clouds), 74
numerical analysis:
Crank–Nicolson finite-difference method, 119–121
Crank–Nicolson finite-difference method (P–T–t paths), 565, 566
of heat conduction, 117–121
Nusselt number, 324 (see also magmatic processes, convection)
observation, 571
obduction, 57, 371
obisidian, 72
dome, Glass Mountain, California, 71, 377
flow, Little Glass Mountain, California, 72
flow, Newberry Volcano, Oregon, 71
ocean floor:
age of, 365
depth versus age, 9, 114, 586
MORB (see MORB)
hydrothermal alteration of, 4, 9, 234, 372,
595 (see also metamorphism, seafloor hydrothermal)
rate of formation, 365
sediments:
contribution to island-arc magmatism, 311
isotopic composition of, 310
ocean water:
circulation through ocean floor, 4, 9, 243, 372
Sr and Nd isotopic composition of, 310
standard mean, (SMOW), values of $^{16}$O/$^{18}$O and $^3$H/$^2$H, 313
oceanic crust, 29, 43
content of radiogenic isotopes, 11
layer 2A, 30
olivine-rich veins, 44
steady-state geotherm, 12
stratigraphy, 43
thickness, 2
ocean island basalts:
alkali olivine basalt, 369
depth of origin, 369
trace element composition of, 369
basanite, 369
composition of 369
depth of origin, 369
early crystallizing minerals in, 369
high $^3$He/$^4$He, 369
isotopic composition in $\varepsilon$Nd/$\varepsilon$Hd plot, 308
tholeiites, 369
ocelli, 292
carbonate, in kimberlite and alnoite, 397
crystal settling in, 343
deformation of melting crystals, 344
occurrence in lamprophyres, 342, 343, 349
origin as immiscible liquid globules, 342, 343
wetting of hornblende crystals, 292
Oka carbonatite, Quebec, 396 (see also Monzegian Province)
oikocryst, 338, 339
Old Faithful geyser, Wyoming, 76
olivine:
$\alpha$–$\beta$ transformation at depth of 400 km, 590
alignment of $\alpha$-axis in:
harzburgite in ophthalmite, 372
oceanic mantle, 370
dendrites in komatite, 273, 399
floating in magma at 10 to 15 GPa, 591, 592
fluid inclusions in mantle olivine, 604
liquids, 208–210
reaction with garnet to form perovskite at depth of 670 km, 590
reaction with magma to form orthopyroxene, 203
Olympus Mons, Mars, 67
Oman, Persian Gulf:
olivine veins in peridotite, 44
ophiolite, 371
ophiolitic (pyroxene), 422, 603
photomicrographs, 421, 426, 561
Ontong Java plateau, 370
ophiolite, 43, 370
associated rocks, 371
hydrothermal alteration, 372
Oman (see Oman)
striatigraphic succession, 371–372 (see also oceanic crust)
chromitite, 372
dunite veins, 372, 373
harzburgite (deformed and serpentinitized), 371
layered gabbros, 372
Mohorovičić discontinuity, 373
pillow lavas, 372
plagiogranite, 372
shoestring dike complex, 373
strata-bound sulfide deposits, 372
transition zone, 372
Troodos, Cyprus, 373
ophitic (see texture)
sferro:
associated with Khibina–Lovozero ring complex, Kola Peninsula, Soviet Union, 88
chromite layers in lopoliths, 96
Dwars River, Bushveld Complex, South Africa, 385
formation through magma mixing, 356, 385
Merensky Reef chromitite layer with PGE, 387
Stillwater, Complex, Montana, 96
diamond, 395–396
hydrothermal, 70, 234, 346
iron–titanium–oxide apatite rocks (nelsite) in massif-type anorthosites, 402
magmatic sulfide deposits, 248, 346
formed through magma mixing, 356
nickel sulfide deposit associated with komatite, Kambalda, Western Australia, 400
nickel sulfide deposit associated with Sudbury meteoorite impact crater, Ontario, 249, 410
niobium and rare earth deposits associated with carbonatite, 397
pegmatite, 255, 346
platinum group elements (PGE), 346
in Merensky Reef, Bushveld Complex, South Africa, 388
porphyry copper deposit, 89, 378
strata-bound sulfide deposit in ophiolites, 372
Skouriotissa, Cyprus, 373
sulfur isotopes in, 314
tin and niobium associated with granitic ring complexes, 88, 393
Orijarvi, Finland, 419
orthocumulate (see igneous cumulates)
diopside–albite–anorthite, 224–226
diopside–anorthite, 196–197, 198
diopside–anorthite–H₂O, 235
diopside–forsterite–anorthite–silica, 234
diopside–nepheline–silica, 220
fayalite–leucite–silica, 223–224
feldspars, 228–230
forsterite–anorthite–silica, 220–223
magma mixing in, 356
forsterite–diopside–silica–H₂O, 233
forsterite–diopside–pyrope, 607
forsterite–nepheline–silica, 606
gedenite–akermanite, 66
nepheline–quartz, 200, 201–202
plagioclase–H₂O, 253
pyroxenes, 230–233
subsolidus phase diagrams (metamorphic) (see activity diagram, 58; chemical potential diagram; petrogenetic grid; pseudosection; T-X CO₂ diagram)
(Mg,Fe)₂SiO₄–CaSiO₃, 211
chlorite + quartz + garnet + H₂O, 278
phase rule, modified (metamorphism), 451 (see also Gibbs phase rule)
phase triangle, 226 (see also tie triangle)
phenocryst, 19, 137
imbrication of, 48
lineation, 48
relation to eutectic composition, 199
rotation near igneous contact, 48
phlogopite: occurrence in alnöite, 394
occurrence in kimberlite, 395
stability limit and reaction products, 394, 591, 604
phonolite flows associated with early rifting, Kenya, 392
phreatomagmatism, 92 (see also diatremes)
phylite, physical characteristics of, 428
phylonite, 441
picrite, 144
definition, 141
piercing point (in phase diagram), 234
piezometric head, 42
pigonite (see also pyroxenes)
exsolution lamellae in augite, 230
inversion to orthopyroxene, 211, 230
Pilanesberg ring complex, South Africa, 89, 90
Pilbara, western Australia (see batholiths)
pillow lava, 57
in mid-ocean axial valley, 366
in ophiolites, 371, 372
Troodos, Cyprus, 373
in Precambrian ocean floor basalt, Ungava, northern Quebec, 34
in Talcott basalt, Connecticut, 58
pipes, segregation in compacting crystal mush, 326
pipe-stem vesicle (see vesicle)
plagioclase: crystallization in the system diopside–albite–anorthite, 224–226
density, 22
growth rate in Makaopuhi lava lake, 285
inclusions of Fe-Ti oxides in, 401
maximum crystal growth rate from melt, 274
neutral buoyancy in basaltic magma, 321
phenocrysts in andesite, 376
reactions with olivine to form spinel and pyroxene, 603
sector zoning in, 277, 278
plagiogranite, 467
in ophitite, 372
plastic deformation, 428
plateau basal, 52
plate tectonics, 4, 15
plate tectonic boundaries: convergence, 14
divergent, 14
transform, 1, 14
platinum group elements (PGE), 346
in Mesensky Reef, Bushveld Complex, South Africa, 388
pleochroic halos, 296, 297
plinian volcanic activity, 35, 69, 73
plug flow of Bingham liquid, 40
plume: see mantle plume
plutonic igneous rock classification (see IUGS)
poikilitic texture (see texture, igneous)
poikolitic, 436
pois (gcs unit of viscosity), 24
Poisson’s ratio, 39, 95
polymerization of magma, 25, 206
polymorphism:
effect on phase transitions with solid solutions, 210–211
high-pressure, due to meteorite impact, 409
of Al₂SiO₄ (see Al₂SiO₄ polymorphs) of enstatite, 230
of quartz and nepheline, 202
transformation of kyanite to andalusite, 167 (see also Al₂SiO₄ polymorphs)
Pompeii (see volcanoes, Vesuvius)
population density (see crystal size distribution)
porosity, 516
pores, 42
intergranular region, 512
metamorphic rocks, 512–514
partially melted mantle, 44
reduction, in sediments, 415
porous flow, 41–43
porphyritic texture (see texture, igneous)
porphyroblastic texture, 435
porphyryblasts, 435

garnet zoning and thermobarometry, 480–482
growth of, 435
inclusions in, 436–440
textures (see texture, metamorphic)
porphyrastinit, 441
porphyry copper deposit, 89, 378
post-tectonic crystal, 438
posttectonic alteration, 532
potassium:
content of magnesian versus depth to Benioff zone, 377
isotopes of, 296
KI in Earth’s core, 11
potential temperature, 237, 366, 370
Precambrian igneous rock associations, 497–405
preferred crystallographic orientation, 432
pressure:
diamond anvil experiments (high P), 6
fluid, 4
generated by vesiculation, 33
gradient, 5
perturbation in, 592
gradient, excess, 28, 31, 36
hydrostatic, 5
in Earth, 4–6
inside bubble due to surface tension, 289
lithostatic, 5
piezometric head, 42
shadows, 430
shock experiments (high P) 6
solution, 289, 415, 430
formation of planar fabric, 340
reduction of porosity in crystal mush, 339
unit of (pscalar), 6
pressure-temperature-time (P-T-t) paths, 481, 482, 560
anticklockwise (counterlockwise), 486, 578
at convergent plate boundaries, 599
clockwise, 486
Cp(T) value of, 570
Cp(T)/ρ value of, 570
crustal thickening, 565
equations for:
avulsion of fluid and magma, 569–570
conduction, 564
conduction-mass transport heating:
radiogenic heating, 565
Crank–Nicolson solution method, 565, 566
excess (exhumation) rates, 567
heat consumption inventory, 575
mass transport (exhumation or burial) heating, 564
radiogenic heating, 564
reaction (chemical), 574
evasion delay preceding exhumation, 568
example of possible path, 562
examples, field:
Ardronbacks, New York State, 578
Barrovian zones, Scotland (magnatism and fluid flow), 572, 580
Bergen Arcs, Norway (eclogite facies), 573–574
Big Maria Mountains, southeastern California, 579
Bristol, New Hampshire, hot spot, 571–572
Bronson Hill antclinorium, Massachusetts, 485–486, 578
continent–continent collision, 578
Dora Maira Massif, western Alps, 577
Franciscan complex, California, 577
granulite facies, 578–579
high-temperature, low-pressure metamorphism, 485, 568, 579–580
Los, Greece, 573
low-temperature, high-pressure (LT/HP) metamorphism, 575–577
Merrimack synclinorium, Massachusetts, 485–486, 578
Naxos, Greece, 573
Papua New Guinea, 577
Pyrenees, 579
Taufin window, eastern Alps, 567, 578
UHP metamorphism, 575
Waterville Formation, Maine, 485
Woguwan Schist, Connecticut, 481, 571
pseudotachylite: pseudosection, 473
pseudoleucite, 207, 208
propylitic alteration, 532
pyroclastic deposits, 34, 70, 73
PyroCeram®, 205
pumpellyite, photomicrograph, 421
pumice, 34, 74, 77

  - Igneous, 19, 47, 275
  - Diabase, 139
  - Dolerite, 139
  - Equilibrium-controlled, 287, 294
  - Eutectic, 77
  - Fission, 77
  - Folution, 49
  - Granophyre, 33, 198, 202, 258
  - Graphic granite, 199, 200, 202, 255, 258
  - Growth or kinetic-controlled, 294
  - Hanritic, 99, 333
  - Interginal, 276
  - Lineation, 48, 49, 97
  - Of fission, 35
  - Optic, 139, 198, 199, 226, 276, 338
  - Planar fabric due to compaction, 340
  - Poikiloblastic, 338, 339
  - Porphyroblastic, 16, 49, 137, 198, 199
  - Protoclastic, 401
  - Psuedoleucite, 207
  - Rapakivi, 215, 230
  - Reactite, 203, 222
  - Spinifex texture, 273, 399
  - Subphotic, 276
  - Vitrophic, 199, 207, 276
  - Metamorphic:
    - Metapelites, 441
    - Beards, 430
    - Blastoporphyrity, 435
    - Cataclastic, 441
    - Cleavage (see cleavage, metamorphic rocks)
    - Crack-seal texture, 544
    - Crack-flow-seal sequence, 550
    - Creulation:
      - Cleavage, 431
      - Lineation, 431
      - Crystalloblastic series, 287, 435
    - Flaser gneiss, 441
- Flinty-crush-rock, 442
- Flaxion structure, 442
- Folution (see cleavage, metamorphic rocks)
- Folution due to pressure solution, 289
- Gneiss, physical characteristics of, 428
- Grain coarsening, 286, 289, 435
- Granoblastic-polygonal, 288
- Helicitic folds, 438
- Interstektonic crystal, 439
- Lineation, 430
- Crenulation, 431
- Stretching, 443
- Mylonite, 442
- Phyllite, physical characteristics of, 428
- Phyllonite, 441
- Psikolith, 436
- Porphyroblastic, 435
- Porphyroclast, 441
- Post-tektontic crystal, 438
- Preferred crystallographic orientation, 432
- Pressure shadows, 430
- Precrystalline crystal, 436
- Precumulus, 442
- Pseudotachylite, 443, 444
- Schist, physical characteristics of, 287, 428
- Schistosity, 436
- Snowball structure, in garnet, 437, 438
- syntectonic crystal, 437
- Twins (deformation), 433, 434
- Ultramylonite, 442
- Thermal conductivity (K), 112
- Value, for crustal rocks, 566
- Thermal diffusivity (d), 112, 564
- Value, for crustal rocks, 567
- Thermal entrance length, 37, 84
- With turbulent flow in dike, 93
- Thermal expansion, coefficient of (D), 21
- Thermal gradient, 112 (see also geothermal gradient)
- Isentropic adiabat, 257
- Potential temperature, 237
- Thermal maximum on liquidus in phase diagrams, 202
- 205, 220, 606 (see also Alkemade's theorem)
- Changes with pressure, 606
- Thermobarometry, metamorphic rocks, 473
- Albite-jadeite-quartz geobarometer, 476
- Calcite-dolomite solvus geothermometer, 478
- Distribution coefficient (Kd), 474
- Examples (see also pressure-temperature-time (P–T–t) paths)
- Bronson Hill anticlinorium, Massachusetts, 485, 486
- Dora Maira Massif, western Alps, 479
- Merinack synclinorium, Massachusetts, 485, 486
- New England, petrologic grid-based geobarometer, 469, 470
- Waterville Formation, Maine, 485, 486
- Wepawaug Schist, Connecticut, 481
- Fe–Mg exchange potential, 474
- Fe–Mg exchange reaction, 473
- Garnet-biotite (GARB) geothermometer, 474
- Garnet-clinoxyroxene geothermometer, 476
- Garnet-clinoxyroxene-phengite geobarometer, 476
- Garnet-ultramylonitic-plagioclase-quartz (GASP) geobarometer, 475

thermodynamics, 149

tie triangle (in phase diagram), 217, 226
Thulean igneous province, 52
thorium, disturbance of decay series and dating subduction-zone processes, 598–599
Thulean igneous province, 52
tie line (in phase diagram), 217 metamorphic compatibility diagrams and, 449
switching reaction, 452, 462
tie triangle (in phase diagram), 217, 226 metamorphic compatibility diagrams and, 449
time-integrated fluid flux (q_int): decarbonation reactions, 533, 557
devolatilization of crustal column, 427
estimates for rocks, 529, 530, 555–556
equations for, 527, 529, 531, 532, 533 geochemical fronts, 525–530 asymmetry of, 530 isotopes and, 529 kinetic treatment of, 539, 540
partial differential equation for, 528
simple time-integrated fluid flux expression, 529
Sr geochemical front, interpretation of, 530 Na-K metasomatic reactions, 532–533 quartz veins, 530–532, 550, 571 Timos, Greece, 436, 561 titanite, sector zoning in, 277 titanium in quartz geothermometer, 191–193 tomato ketchup, viscosity, 24
tomography:
seismic, 3
seismic, beneath Kilauea volcano, 61–62 X-ray CT image of basalt, 43, 329 tortuosity factor, 517
total differential of Gibbs free energy, 160
tourmaline in pegmatite, 257
trace element, 132
fractionation in magmas, 356–361 Berthelot–Nemst (equilibrium), 358
Rayleigh, 358
Henry’s law and distribution of, 184 trachyte, occurrence on ocean islands, 369
transform plate boundaries: exposure of, on ocean floor, 370
thermal effects of, 1, 14 Vema transform, 370 translation gliding, 433
trap rock, 52
texture and strength of, 55 tridymite, 207
trolite, in metasomites, 131, 132
trondhjemite (low K Na), preponderance during Archean, 398
derived from partial melting of theesitic basalt, 398
Troodos Massif (ophiolite), Cyprus, 371, 373 strata-bound sulfide deposits, 372, 373
sulf, 70, 74 (see also pyroclastic deposits): welded ash-flow, 77
tuff, 89
West Cork, Ireland, 91
tungsten 184W, formation from decay of 184Hf, 302
turbulent flow, 24
through dike, 41
tuya, 66
Herdisrubel Mountain, Iceland, 66 twin gliding, 433, 434

T–XCO2 diagram (see also fluids, metamorphic):
common reactions, 495, 499–501, 506, 541
H2O–CO2 transport-reaction across lithologic contacts, 542
isobaric invariant point, 541, 501, 504
Schreinemakers rules and, 500
topology of, 497–499
ultra-alkaline undersaturated igneous rocks (see igneous rock associations)
ultrahigh-pressure (UHP) metamorphism (see metamorphism, ultrahigh temperature)
ultrahigh-temperature (UHT) metamorphism (see metamorphism, ultrahigh temperature)
ultramafic igneous rock, 137
melilite zones, 544
metamorphism of, 424
ultramylonite, 442
underplating, 4, 15, 31, 106
uniformitarianism, 97, 397
unstable (see stability)
uplift of rock, 560
up-T fluid flow, 532, 533
uranium: disturbance of decay series and dating subduction-zone processes, 598–599 isotopes of, 296
vacancies in crystal structures (see diffusion)
vanadium, concentration in magma affected by magmatic crystallization, 359
van der Waals equation, 491
van’t Hoff equation (Gibbs–Helmholtz), 191
variance (degrees of freedom) of a system, 164, 165, 170, 201
variation diagrams, 317–321
Differentiation Index (D.I.), 320
FeO, MgO, Na2O + K2O (FMA), 317
Harper (silica), 320
magnesium number (M), 318
quantitative use of, 320
veins, 544
abundance, in outcrop, 546
crack–seal texture, 544
crack-flow–seal sequence, 550
dunite, in orthosite, 44, 372, 373, 601
fracturing (see fractures, metamorphic) grain size, 550
heat transfer, 571–572
mass precipitated in, 550
mineral progression with grade, Dutchess County, New York, 520
photographs, 419, 547, 549
silvages, 547, 548, 550–555
sequences of vein-forming events, 550
solubility of minerals and, 519–520
time-integrated fluid flux, quartz veins, 530–552, 550, 571
timescales of fluid flow, 548
timeting of formation, 548
wall rock, 547
velocity of:
ascent of basalt at Pali-Aike, Chile, 28
eruption of basalt at Lakagigar, Iceland, 79
eruption of diatreme, 91
eruption of Kilauea, 51
eruption of kimberlite, 28
laminar flowing magma in dike, 38
laminar flowing magma in pipe, 37
turbulent flowing kimberlite magma in pipe, 93
turbulent flowing magma in dike, 41
turbulent flowing magma in lava flow, 38
Vema transform, 370
vesicle, 33, 64
pyroclastic deposits): cylinders, 58, 59, 326
defined by flow, 48, 49
in aa, 64
in flood basalt, 58
in pahoehoe, 64
pipe-stem, 58, 59, 64
vesiculation of magma, 24
Vesuvius, Italy (see volcanoes)
Vinalhaven, Maine, basalt inclusions in granite, 105
Vitamin Gorda, British Virgin Islands, basalt inclusions in granite, 105
viscosity, 23
andesite magma, 24
basalt magma, 24
Bingham liquid, 23
bulk, 23
calculation from chemical analysis, 25
calculation from MELTS, 25
calculation from chemical composition control of, 25
Einstein limit, 23
granite magma, 25
kimberlite magma, 24
kinematic, 24
komatite magma, 24
magma, 23–25
effect of solubility of H2O, 25, 246
Newtonian, 23, 40
non-Newtonian, 23
pseudoplastic, 24
rhyolite magma, 24
shear thinning, 24
viscosity, (cont.)
temperature effect on, 25
temperature range, 24
values for magmas and common
substances, 23
water, effect of, 25
yield strength, 23
vitrophytic (see texture, igneous)
VolatilesCalc (software program), 246
volatiles:
composition in fumaroles, 70
concentration in anodesites, 611
enrichment toward top of
batholith, 108
in kimberlite, 93
metamorphic, 415–417 (see also fluids,
metamorphic)
origin of in diatremes, 91–92
release during metamorphism, 15
release from volcanoes, 70
release of H2O from subducting slab,
17, 593
volcanic:
ash (see pyroclastic deposits)
bomb, 35, 65, 70
Explosivity Index (VEI), 71
gases, 243
Explosive Index (VEI), 71
bomb, 35, 65, 70
release of H2O from subducting slab,
17, 593

More information
zircon:
lutetium in, 303
oldest (4.4 Ga), Jack Hills, Western Australia, 305
use in absolute dating by U–Pb method, 300
zone melting, 349
zonation, chemical, in metamorphic minerals:
apatite, metamorphic timescale estimation, 572, 580
garnet:
diffusion, metamorphic timescale estimation, 572
disequilibrium growth, 289, 291
Mn growth zoning, 279, 291
zoning and thermobarometry, 480–482
general discussion, 480, 561, 562
glaucophane, 561
zones, metamorphic
(see index mineral zones)
zoning (of crystals) (see also sector zoning):
branched, in garnet, 291
hourglass, 277
normal, 210
oscillatory, 49, 191, 277, 376
resulting from Rayleigh fractionation, 279
sector, 258, 277–278, 303
