<i>Foreword by Yves Quéré</i>	<i>page xi</i>
<i>Preface</i>	<i>xiii</i>
<i>Acknowledgments</i>	<i>xv</i>
1 General points on materials and their rheophysical behaviour	1
1.1 The Hookean elastic solid and the Newtonian viscous fluid	3
1.2 The plastic solid and the non-Newtonian viscous fluid	5
1.3 Thixotropy and antithixotropy	10
1.4 Yield stress liquids (thixotropic)	12
1.5 Viscoelastic fluids	17
1.6 Viscoelastic solids	33
1.7 Liquid crystals	37
References	43
2 Overview of the mechanics of continuous media	45
2.1 Stress tensor and surface torque tensor	46
2.2 Mass and momentum conservation laws	49
2.3 Torque balance equation and symmetry of the stress tensor	51
2.4 Irreversible entropy production and constitutive laws	53
Appendix 2.A Theorem of ‘derivation under the integral’	55
3 Hydrodynamics of simple liquids	57
3.1 Rheological behaviour law and the Fourier law	58
3.2 The equations of hydrodynamics	68
3.3 Reynolds number	81
3.4 Boundary layer and wake: the example of the vorticity line source	86
3.5 High Reynolds number flow: the perfect fluid approximation	87
3.6 Boundary layer theory	103
3.7 Flow at low Reynolds number	114
3.8 Viscosity measurements	142
Appendix 3.A Tangential discontinuities and shock waves (in perfect fluids)	157

Appendix 3.B	Hydrodynamic equations for an incompressible fluid	166
	References	168
4	Elasticity of solids	170
4.1	Elastostatics of ordinary hard solids	171
4.2	Elastodynamics of ordinary hard solids	213
4.3	Elasticity of colloidal crystals	222
Appendix 4.A	Elasticity equations in cylindrical and spherical coordinates	235
	References	237
5	Defects, plasticity and fracture of solids	239
5.1	General points on crystal defects	240
5.2	Dynamics of dislocations and elastic limit	267
5.3	Some plasticity models	294
5.4	Crystal fracture	311
5.5	Plasticity of colloidal crystals and melting under shear	318
Appendix 5.A	Demonstration of the Peach and Koehler formula	320
Appendix 5.B	Interaction energy between a dislocation and a spherical cavity	322
	References	323
6	Rheology of isotropic viscoelastic materials: macroscopic aspects	326
6.1	Linear and nonlinear regimes	328
6.2	Linear viscoelasticity and oscillating flow	328
6.3	Nonlinear viscoelasticity and continuous flow	356
6.4	Calculation of the viscometric functions and their relation with the functions of linear viscoelasticity	374
6.5	'Time-temperature' superposition principle	397
6.6	Saffman-Taylor finger in complex fluids	399
	References	404
7	Rheology of isotropic viscoelastic materials: examples and microscopic theories	406
7.1	Polymer melts	408
7.2	Example of an elastomer from the family of viscoelastic solids: vulcanised rubber	447
7.3	Polymers in semi-dilute solution	451
7.4	'Living polymers': the example of giant micelles formed in surfactant solutions	460
7.5	Dispersions	471
Appendix 7.A	Hookean dumbbell model	501
Appendix 7.B	The Giesekus and FENE models	503
Appendix 7.C	Demonstration of the Einstein formula	506
	References	509
8	Rheology of liquid crystals	511
8.1	Nematodynamics	513

<i>Contents</i>		ix
8.2 Smectodynamics		555
8.3 Canodynamics		597
Appendix 8.A Simplified derivation of the Frank–Oseen free energy		604
References		605
<i>General references</i>		608
<i>Notation</i>		611
<i>Index</i>		614
