

Contents

1 Introduction	1
2 Evidence for the Non-image-Forming Pathways and Novel Retinal Photoreceptors	2
3 Intrinsically Photosensitive Retinal Ganglion Cells	4
4 Methodological Considerations for the Experimental Control of Photoreception in Humans	14
5 The Pupil as a Measure of Non-image-Forming Vision	18
6 Melanopsin-Driven Light Adaptation Modulates Rod- and Cone-Mediated Functions	21
7 Spatio-Temporal Response Properties of Melanopsin Photoreception	23
8 Melanopsin-Expressing ipRGCs Drive an Independent Dimension of Conscious Visual Perception in Humans	25
9 Circadian Rhythms and ipRGCs	28
10 The Non-image-Forming Pathways Set Arousal and Cognition	32
11 Harnessing Light in the Built Environment	36
12 Future Directions, Unknowns, and Conclusions	39
