

CASE STUDIES

Stahl's Essential Psychopharmacology

"In today's complex and burdened healthcare environment, this essential psychopharmacology for child and adolescent psychiatry gives the busiest clinicians readily available tools to navigate complex scenarios with clear, sequential, and logical guidance. The clinical pearls are written in pragmatically and with adult learning principles in mind. Thank you, Dr's Stahl and Strawn, for capitulating the wisdom of our field in such an accessible and engaging way."

Manpreet Kaur Singh, MD, MS

Associate Professor of Psychiatry and Behavioral Sciences Stanford University, Stanford, CA, USA

"Dr's Strawn and Stahl have really done it! The case-based teaching format and dozens of easy-to-read graphs and illustrations, walks clinicians of all levels through the complex world of pediatric psychopharmacology. Using easy-to-follow color-coded backgrounds and icons, the cases illustrate the evolution of each patient's treatment, the interplay of science and clinical wisdom, and the common pitfalls in the practice of pediatric psychopharmacology. In this era of rapidly advancing knowledge, this book provides a foundation rooted in the latest clinical pharmacology literature; it is a must-read for anyone practicing pediatric psychopharmacology."

John T. Walkup, MD

Margaret C. Osterman Professor of Psychiatry Chair, Pritzker Department of Psychiatry and Behavioral Health Ann and Robert H. Lurie Children's Hospital of Chicago, IL, USA President-Elect, American Academy of Child & Adolescent Psychiatry

"This collection of case studies is the most comprehensive and clinically relevant that I have ever read. As a practicing Child and Adolescent Psychiatrist, I have come face to face with many of the same clinical presentations and found Dr Strawn's review of the management thoughtful and integrative.

The way the text is written provides a unique framework for how to approach these difficult interactions and gives a glimpse into how to combine science with the art of psychopharmacology when the evidence base is lacking.

I wholeheartedly believe this text is a must have for any Child and Adolescent Psychiatrist's library. I will certainly use it when teaching my residents and fellows and in my own practice as well."

Nicole M. Ballinger, DO, MPH, FAPA

Adult, Child and Adolescent Psychiatrist

Medical Staff President/ Director Child and Adolescent Psychiatry Partial Hospital Program/Site Director, Child and Adolescent Psychiatry Fellows and Residents for Aurora Psychiatric Hospital, Wauwatosa, WI, USA

Clinical Associate Professor, Department of Psychiatry and Behavioral Medicine, Medical College of Wisconsin and Affiliated Hospitals

1	The Case: The salutatorian who couldn't speak: selective serotonin reuptake inhibitor (SSRI)-refractory anxiety in an adolescent The Question: What do you do when anxiety fails to respond to multiple SSRIs and cognitive—behavioral therapy (CBT)? The Psychopharmacological Dilemma: Whether and when to add adjunctive benzodiazepines remains unclear for many clinicians	1
2	The Case: From anxious to activated: selective serotonin reuptake inhibitor (SSRI)-related activation The Question: How can clinicians predict side effects associated with SSRIs in children and adolescents? The Psychopharmacological Dilemma: Balancing side effects, side-effect management, and efficacy is challenging	17
3	The Case: The girl who couldn't sleep: posttraumatic stress disorder (PTSD) in a young girl The Question: When should adjunctive medications be used in pediatric PTSD? The Psychopharmacological Dilemma: Randomized clinical trials of first-line medications, such as selective serotonin reuptake inhibitors (SSRIs), in adults with PTSD generally fail to show benefit in children and adolescents with PTSD	35
4	The Case: Depressed and still depressed: major depressive disorder (MDD) in an adolescent The Question: When should adjunctive medications be used in adolescents with treatment-resistant MDD? The Psychopharmacological Dilemma: There is uncertainty regarding how and when to "change course" in managing treatment-resistant MDD in adolescents, and adjunctive medications may have unique tolerability concerns related to primary pharmacotherapy in this age group	49

Contents

5	The Case: A 13-year-old adolescent who feels "amazing": selective serotonin reuptake inhibitor (SSRI)-induced mania in an adolescent The Questions: What medications should be used in an adolescent who develops mania when treated with an SSRI? Does SSRI-related mania represent bipolar disorder? The Psychopharmacological Dilemma: How to treat patients who are at "high risk" for developing bipolar disorder but are experiencing depressive and/or anxiety symptoms presents a challenge for many clinicians, particularly as SSRIs are the first-line pharmacotherapy for adolescents with depressive and anxiety disorders	65
6	The Case: Counting on a cure: obsessive compulsive disorder (OCD) in an adolescent The Question: When should medications other than selective serotonin reuptake inhibitors (SSRIs) be used, and how should clomipramine be dosed and monitored in pediatric OCD? The Psychopharmacological Dilemma: The decision to move beyond SSRIs in treating adolescents with OCD is difficult for many clinicians. In addition, some clinicians experience trepidation about initiating clomipramine and using therapeutic drug-monitoring strategies	77
7	The Case: Struggles in the second grade: attention-deficit hyperactivity disorder (ADHD) in a child The Question: When should nonstimulant medications be used in pediatric patients with ADHD? The Psychopharmacological Dilemma: When to add nonstimulants to stimulant medications in children with ADHD is unclear for many clinicians. Furthermore, how to choose a nonstimulant, based on the mechanism of action, is a source of uncertainty	95
8	The Case: From prodrome to psychosis: early-onset schizophrenia The Question: What constitutes an evidence-based work-up for children and adolescents who have prodromal psychotic symptoms or are experiencing a first psychotic episode? The Psychopharmacological Dilemma: The approach to the young patient with a possible psychotic disorder is unclear for many clinicians, and varies considerably in practice. How specific factors should be considered and what interventions should be used are common questions for clinicians	119
9	The Case: Too much, too little, or just right? Lithium dosing in an adolescent The Question: How is lithium dosed differently in adolescents compared with adults?	137

SSRIs

Cambridge University Press & Assessment 978-1-009-04896-5 — Case Studies: Stahl's Essential Psychopharmacology Edited by Jeffrey R. Strawn, Stephen M. Stahl Frontmatter More Information

Contents

The Psychopharmacological Dilemma: Approaches to monitoring and dosing lithium in pediatric patients differ substantially from the strategies used in adults. This confusion often complicates lithium use and monitoring in adolescents, and represents a significant barrier to using lithium

- 10 The Case: Tic, tic, tic: motor and vocal tics in a boy
 The Question: What is the role of pharmacotherapy in Tourette syndrome?
 The Psychopharmacological Dilemma: Although tics can be common in children and adolescents, choosing among pharmacological approaches to management of Tourette syndrome is complex
- 11 The Case: How slow can you go? Selective serotonin reuptake inhibitor (SSRI) withdrawal and discontinuation in an adolescent 173

 The Questions: When should SSRIs be discontinued in adolescents? How should SSRIs be discontinued in adolescents? What are the strategies for managing SSRI-related discontinuation symptoms?

 The Psychopharmacological Dilemma: Stopping SSRIs after remission is certainly a goal of treating adolescents with depressive and anxiety disorders, although clinicians vary in their thresholds for discontinuing these medications, and disagree about approaches to discontinuation of
- 12 The Case: The adolescent who doesn't eat: anorexia nervosa in an adolescent

The Questions: What is the "medical" workup in a child or adolescent with an eating disorder? When should a child or adolescent with anorexia nervosa be hospitalized? What is the psychopharmacological approach to treating eating disorders and related behaviors in children and adolescents?

The Psychopharmacological Dilemma: Eating disorders can create anxiety for many clinicians as a result of confusion related to the medical workup for these patients, treatment decisions, and special considerations related to using pharmacotherapy in this population

13 The Case: High or higher antidepressant concentrations? Cannabis-related drug interactions in an adolescent
The Questions: How does cannabis affect outcomes in adolescents with depressive disorders? What is the impact of cannabis on selective

serotonin reuptake inhibitor (SSRI) pharmacokinetics in adolescents? **The Psychopharmacological Dilemma:** Cannabis use is increasingly common in adolescents, yet the pharmacological implications are unclear for many clinicians

Contents

14	The Case: The boy whose bed was always wet: nocturnal enuresis in a child The Question: What is the role of pharmacotherapy in managing nocturnal enuresis in children? The Psychopharmacological Dilemma: Views on when and how to use pharmacotherapy in children with nocturnal enuresis vary considerably among clinicians	223
15	The Case: Counting sheep and counting treatment trials: insomnia disorder in an adolescent The Question: What is the evidence-based approach to addressing insomnia in adolescents? The Psychopharmacological Dilemma: Managing sleep-related problems in adolescents – particularly in those with anxiety and/or depressive disorders – is complicated and requires an understanding of developmental and pharmacological principles	233
16	The Case: Second-generation antipsychotics/mixed dopamine—serotonin receptor agonists (SGAs), side effects, and the autism spectrum: SGA-related side effects in a boy with autism spectrum disorder (ASD) The Questions: What is the evidence-based workup for a child with ASD? Which SGAs have evidence for specific symptoms in children and adolescents with ASD and how should they be diagnosed? How should tolerability of SGAs be monitored in children and adolescents with ASD? The Psychopharmacological Dilemma: Managing SGAs in children and adolescents with ASD can be complicated, but awareness of pharmacological/pharmacogenetic principles can help to predict specific tolerability concerns	259
17	The Case: The "standard treatment" is earning a "D": treatment-resistant schizophrenia The Question: When and how should clozapine be used in older adolescents with treatment-resistant schizophrenia? The Psychopharmacological Dilemma: When to use clozapine and how to dose and monitor its use is a source of debate and uncertainty for many clinicians, yet the evidence – largely based on decades of studies in adults – suggests that this agent has response rates substantially higher than those for other second-generation antipsychotics (SGAs) in patients with treatment-resistant schizophrenia	279
18	The Case: Symptoms, side effects, or both? Selective serotonin reuptake inhibitor (SSRI) tolerability and physical symptoms in an anxious adolescent	301

Viii

Contents

The Questions: How should SSRIs be cross-titrated in adolescents? What is mechanism-based inhibition, and how does it relate to the pharmacokinetics of some SSRIs in adolescents?

The Psychopharmacological Dilemma: SSRIs are commonly associated with tremendous improvement in adolescents with anxiety and depressive disorders; however, they may be associated with side effects that require medication changes. Cross-titrating SSRIs requires an understanding of both pharmacodynamic and pharmacokinetic principles

Introduction

Following the success of the third volume of *Case Studies* in 2021, we are very pleased to present a fourth collection of new clinical cases. This collection of cases comes from Dr. Strawn's clinics and consultations, from his research in clinical pharmacology, and from discussions with his talented collaborators, including pharmacologists, nurse practitioners, psychologists, and fellow child and adolescent psychiatrists. *Stahl's Essential Psychopharmacology* started in 1996 as a textbook (currently in its fifth edition) on how psychotropic medications work. It expanded to a companion Prescriber's Guide in 2005 (currently in its seventh edition) on how to prescribe psychotropic medications. In 2008, a website was added (**stahlonline.cambridge.org**) with both of these books available online in combination with several more, including an illustrated series of books covering specialty topics in psychopharmacology. The *Case Studies* show how to apply the concepts presented in these previous books to real patients in a clinical practice setting.

Why a case book? For practitioners, it is necessary to know the science and application of psychopharmacology – namely, both the mechanism of action of psychotropic medications and the evidence-based data on how to prescribe them – but this is not sufficient to become a master clinician. Many patients are beyond the data and are excluded from randomized controlled trials. Thus, a true clinical expert also needs to develop the art of psychopharmacology: namely, how to listen, educate, destigmatize, mix psychotherapy with medications, and use intuition to select and combine medications. The art of psychopharmacology is especially important when confronting the frequent situations where there is no evidence on which to base a clinical decision.

What do you do when there is no evidence? The short answer is to combine the science with the art of psychopharmacology. Being able to combine science and art and to adapt findings from studies in adults is critical for clinicians treating children and adolescents. However, the successful psychiatric clinician working with children and adolescents must not only integrate science and art but also do so with a strong background in developmental pharmacology, attention to development, learning disorders, and family dynamics. The best way to learn this approach is probably by seeing individual patients and their families. Here we hope you will join us and peer over our shoulders to observe these complex cases from our child and adolescent psychiatric clinics and consultations. Each case is anonymized in identifying details, but incorporates real case outcomes that are not fictionalized. Sometimes more than one case is combined into a single case. Hopefully, you will recognize many of these patients as similar to those you have seen in your own practice (although they will not be exactly the same patient, as the identifying historical details are changed here to comply with disclosure standards, and many patients can look very much like many other patients you know, which is why you may find this teaching approach effective for your clinical practice).

Introduction

We have presented cases from our clinical practice for many years and in courses (especially at the annual Neuroscience Education Institute Psychopharmacology Congress). Over the years, we have been fortunate to have many young child and adolescent psychiatrists and other trainees from our universities, and indeed from all over the world, sit in on our practices to observe these cases, and now we attempt to bring this information to you in the form of a fourth case book.

The cases are presented in a novel written format in order to follow consultations over time, with different categories of information designated by different background colors and explanatory icons. For those of you familiar with *The Prescriber's Guide*, this layout will be recognizable. Included in the case book, however, are many unique sections as well; for example, presenting what was on our minds at various points during the management of the case, and also questions along the way for you to ask yourself in order to develop an action plan. Additionally, these cases incorporate ideas from the recent changes in the maintenance of certification standards by the American Board of Psychiatry and Neurology, for those of you interested in recertification in psychiatry. Thus, there is a section on Performance in Practice (called here "Confessions of a psychopharmacologist"). There is a short section at the end of several cases looking back and seeing what could have been done better in retrospect. Another section of most cases is a short psychopharmacology lesson or tutorial, called the "Two-minute tutorial," with background information, tables, and figures from literature relevant to the case in hand. Medications are listed by their generic and brand names for ease of learning. Indexes are included at the back of the book for your convenience. Lists of icons and abbreviations are provided in the front of the book. Finally, this fourth collection updates the reader on the newest psychotropic medications and their uses, and adopts the language of DSM-5.

The case-based approach is how this book attempts to complement "evidence-based prescribing" from other books in the *Essential Psychopharmacology* series, plus the literature, with "prescribing-based evidence" derived from empiric experience. It is certainly important to know the data from randomized controlled trials, but after knowing all this information, case-based clinical experience supplements those data. The old saying that applies here is that wisdom is what you learn *after* you know it all, and the same can be said for studying cases after seeing the data.

A note of caution: we are not so naïve as to think that there are not potential pitfalls to the centuries-old tradition of case-based teaching. Thus, we think it is a good idea to point some of them out here in order to try to avoid these traps. Do not ignore the "law of small numbers" by basing broad predictions on narrow samples or even a single case.

Do not ignore the fact that if something is easy to recall, particularly when associated with a significant emotional event, we tend to think it happens more often than it does.

Do not forget the recency effect, namely, the tendency to think that something that has just been observed happens more often than it does.

Introduction

According to editorialists,¹ when moving away from evidence-based medicine to case-based medicine, it is also important to avoid:

- eloquence- or elegance-based medicine
- vehemence-based medicine
- providence-based medicine
- diffidence-based medicine
- nervousness-based medicine
- confidence-based medicine.

We have been counseled by colleagues and trainees that perhaps the most important pitfall for us to try to avoid in this book is "eminence-based medicine," and to remember specifically that:

- radiance of gray hair is not proportional to an understanding of the facts
- eloquence, smoothness of the tongue, and sartorial elegance cannot change reality
- qualifications and past accomplishments do not signify privileged access to the truth
- experts almost always have conflicts of interest
- clinical acumen is not measured in frequent flier miles.

Thus, it is with all humility as practicing psychiatrists that we invite you to walk a mile in our shoes; experience the fascination, the disappointments, the thrills, and the learnings that result from observing cases in the real world.

More Information

List of Abbreviations

NAC	<i>N</i> -acetylcysteine	PSG	polysomnography
NAMI	National Alliance on	PSI	Processing Speed Index
	Mental Health	PTEN	phosphatase and tensin
NSAID	nonsteroidal anti-		homolog
	inflammatories	PTSD	posttraumatic stress
NDRI	norepinephrine-		disorder
	dopamine reuptake	QIDS	Quick Inventory
	inhibitor		of Depressive
NE	norepinephrine		Symptomatology
NET	norepinephrine	QIDS-SR	Quick Inventory
	transporter		of Depressive
NICU	neonatal intensive care		Symptomatology – Self-
	unit		Report
NMDA	<i>N</i> -methyl-p-aspartate	QTc	corrected QT interval
NSF	National Sleep	SCARED	Screen for Child Anxiety-
	Foundation		Related Emotional
OCD	obsessive compulsive		Disorders
	disorder	SCN	suprachiasmatic nucleus
ODD	oppositional defiant	SERT	serotonin transporter
	disorder	SGA	second-generation
OGT	oxygenated glycerol		antipsychotic/mixed
	triester		dopamine-serotonin
OROS	osmotic controlled-		receptor agonist
	release oral delivery	SNRI	serotonin-norepinephrine
	system		reuptake inhibitor
PAI-A	Personality Assessment	SRI	serotonin reuptake
	Inventory for		inhibition
	Adolescents	SSRI	selective serotonin
PANSS	Positive and Negative		reuptake inhibitor
	Symptoms of	T_3	triiodothyronine
	Schizophrenia	T ₄	thyroxine
PET	positron emission	TAT	Thematic Apperception
	tomography		Test
PFC	prefrontal cortex	TCA	tricyclic antidepressant
PHQ-9	Patient Health	TF-CBT	trauma-focused cognitive
	Questionnaire-9		behavior therapy
PLM	periodic limb movement	THC	Δ9-tetrahydrocannabinol
PLMi	Periodic Limb Movement	TMS	transcranial magnetic
	Index		stimulation
PMDD	premenstrual dysphoric	TORDIA	Treatment of SSRI-
	disorder		Resistant Depression in
P0	oral		Adolescents study
PPT	pedunculopontine	TSH	thyroid-stimulating
	tegmentum		hormone

List of Abbreviations

UCLA	University of California	VP	Visual Puzzles
	Los Angeles	VSCC	voltage-sensitive calcium
V_2	vasopressin-2 receptor		channel
VČI	Verbal Comprehension	VSI	Visual-Spatial Index
	Index	VTA	ventral tegmental area
VEGF	vascular endothelial	WISC(-IV/V)	Wechsler Intelligence
	growth factor		Scale for Children
VLPFC	ventrolateral prefrontal		(4th/5th edition)
	cortex	WMI	Working Memory Index
VMAT2	vesicular monoamine	YMRS	Young Mania Rating
	transporter-2		Scale
