

Reproductive Biology of Angiosperms

The science of understanding plant reproduction is more than four hundred years old. Today, with integration of molecular biological tools, plant reproductive biology has catapulted into an exciting field of research. It has become an integral part of evolutionary biology, conservation biology, climate change studies, population biology, genetics, horticulture and many more fields. Considering the widening scope of plant reproductive biology, this book focusses on teaching the core concepts of plant reproduction supplemented with latest findings in the field. Uniquely, this book addresses both theoretical and practical perspectives by providing easy protocols of experiments related to the content of each chapter, thus, making the book useful for an entire spectrum of students, teachers and researchers.

The content of the book is designed for the undergraduate syllabi of embryology, reproductive biology of flowering plants, reproductive ecology of flowering plants, and plant breeding, taught in universities across the country. The content is well-supplemented with photographs and illustrations to enhance the understanding of the structures and processes involved in plant reproduction. Interesting information, which may incite the curiosity of learners, appears at appropriate places in the narrative in a box format. Detailed comparisons of similar/related concepts which commonly are difficult to comprehend for first-time learners are especially brought out in the text. The key concepts are revisited at the end of each chapter in the form of glossary. Practice questions at the end of each chapter have been added as part of pedagogical approach of conceptual learning. To help readers develop a complete understanding of the subject, step-by-step description of experiments related to the content are also provided.

Yash Mangla is Assistant Professor in the Department of Botany at Acharya Narendra Dev College, University of Delhi. His specialization is developmental, molecular, and reproductive biology of angiosperms.

Priyanka Khanduri is Assistant Professor in the Department of Botany at Vidyasagar Metropolitan College, University of Calcutta. Her research interests include developmental and reproductive biology of angiosperms, and phylogenetics.

Charu Khosla Gupta is Professor of Botany at Acharya Narendra Dev College, University of Delhi, with teaching and research experience spanning 24 years. She specializes in reproductive biology of angiosperms. She is the recipient of Teaching Excellence Award for innovation (2015) from the University of Delhi and Meritorious Teacher Award (2020) from the Directorate of Higher Education, Government of NCT of Delhi.

Contents

<i>Foreword</i>	<i>xvii</i>
<i>Preface</i>	<i>xxi</i>
<i>Acknowledgments</i>	<i>xxiii</i>
<i>Image Sources</i>	<i>xxv</i>
Chapter 1. An Introduction to the Reproductive Biology of Flowering Plants	1
1.1 Different Aspects of Reproductive Biology of Flowering Plants	1
1.2 Scope of Reproductive Biology of Angiosperms	5
Chapter 2. The Flower	9
2.1 Introduction	9
2.2 Organization of a Flower	11
2.3 Sexual Diversity in Angiosperms	14
2.4 Origin of Flower	16
2.5 Induction of Flowering	18
2.6 ABCDE Model of Floral Organ Development	18
Glossary	20
Key Questions	21
Practicals	
Exercise 2.1: To study important morphological features of randomly selected flowers	21
Exercise 2.2: To observe the sexuality of randomly selected flowers	23
Chapter 3. Brief Historical Account on Transformation of Classical Embryology to Integrated Reproductive Biology	25
3.1 Early Discoveries	25
3.2 Era of Exploration	26
3.3 Years that Laid the Foundation	27
3.4 Broadening Horizons	30
3.5 Integration of Ecological, Evolutionary and Genetical Approaches to the Study of Plant Reproductive Systems	35
Chapter 4. The Anther and Male Gametophyte	40
4.1 Introduction	40
4.2 Anther Structure and Development	41

4.2.1	Structure	41
4.2.2	Development	42
4.2.2.1	<i>Phase I</i>	43
4.2.2.2	<i>Phase II</i>	45
4.3	Anther Wall Layers	45
4.3.1	Epidermis	46
4.3.2	Endothecium	48
4.3.3	Middle Layers	51
4.3.4	Tapetum	52
4.4	Anther Dehiscence	57
4.5	Pollen Development	60
4.5.1	Microsporogenesis	60
4.5.1.1	<i>Cytokinesis during Microsporogenesis</i>	64
4.5.1.2	<i>Role of Callose during Microsporogenesis</i>	66
4.5.2	Microgametogenesis	66
4.5.2.1	<i>Vegetative and Generative cell</i>	68
4.5.2.2	<i>Bi- and Tri-cellular Pollen Grains</i>	69
4.6	Male Germ Unit (MGU)	71
4.6.1	Structure	72
4.6.2	Functions	72
4.6.3	Sperm Dimorphism	74
4.7	Pollen Wall: Structure, Synthesis and Features	74
4.7.1	Pollen Wall Structure	75
4.7.2	Pollen Wall Synthesis	75
4.7.3	Pollen Coat Substances	80
4.8	Characteristics of Pollen	81
4.8.1	Pollen Dispersal Unit	82
4.8.2	Pollen Aperture	85
4.8.3	Pollen Polarity	87
4.8.4	Pollen Symmetry	88
4.8.5	Pollen Shape	88
4.9	NPC System	88
4.10	Nemec Phenomenon	89
4.11	Pollen Development and Metabolism	91
	Glossary	93
	Key Questions	95
Practicals		
	Exercise 4.1: To study anther wall layers and microsporogenesis	96
	Exercise 4.2: To study a mature anther and its dehiscence	97
	Exercise 4.3: To study the ultrastructure of pollen wall layers using transmission electron micrograph	100

Contents	ix
Exercise 4.4: To identify the cellular stage of pollen at the time of anther dehiscence	100
Exercise 4.5: To study the ultrastructure of male germ unit	102
Exercise 4.6: To test the pollen grain fertility and viability	103
Exercise 4.7: To estimate the production of pollen grains in a flower	107
Exercise 4.8: To study the morphological features (shape, exine pattern and aperture) of pollen grains of different species	108
Chapter 5. The Ovule and Female Gametophyte	119
5.1 Introduction	119
5.2 Basic Structure of Ovule	120
5.3 Development of Ovule	121
5.4 Ovule Diversity	122
5.4.1 Types of Ovule on the Basis of Degree of Curvature	122
5.4.2 Types of Ovule on the Basis of Thickness of Nucellus	126
5.5 Structures Associated with Ovules	127
5.6 Development of Female Gametophyte	131
5.6.1 Megasporogenesis	132
5.6.2 Selection of Functional Megaspore and Types of Embryo Sac Development	132
5.6.3 Megagametogenesis	136
5.6.4 Different Types of Embryo Sac	138
5.6.4.1 <i>Monosporic Embryo Sacs</i>	138
5.6.4.2 <i>Bisporic Embryo Sacs</i>	139
5.6.4.3 <i>Tetrasporic Embryo Sacs</i>	140
5.6.4.4 <i>Embryo Sac Development in Chrysanthemum cinerariaefolium</i>	143
5.7 Cellular Anatomy and Ultrastructure of Cells of Embryo Sac	144
5.7.1 Egg Cell	145
5.7.2 Synergids	147
5.7.3 Central Cell	150
5.7.4 Antipodal Cells	150
5.8 Unique Ovules and Embryo Sacs	151
Glossary	153
Key Questions	154
Practicals	
Exercise 5.1: To study different types of ovules	155
Exercise 5.2: To study special ovular structures	158
Exercise 5.3: To study monosporic, bisporic and tetrasporic types of embryo sac development	159
Exercise 5.4: To study Polygonum-type of embryo sac development	163
Exercise 5.5: To study the ultrastructure of egg cell, synergids and central cell	164
Exercise 5.6: To estimate number of ovules in a flower	166
Exercise 5.7: To assess the receptivity of ovules using Toluidine Blue 'O' test	168

Chapter 6. Pollination	174
6.1 Introduction	174
6.2 Types of Pollination: Self and Cross	175
6.2.1 Self-Pollination	176
6.2.2 Cross-Pollination	177
6.3 Mechanisms to Promote Cross-Pollination	179
6.4 Modes of Pollination	181
6.5 Abiotic Pollination	182
6.5.1 Pollination by Wind: Anemophily	182
6.5.2 Pollination by Water: Hydrophily	185
6.6 Biotic Pollination	188
6.6.1 Pollination by Insects: Entomophily	188
6.6.1.1 <i>Bee and Wasp Pollination</i>	189
6.6.1.2 <i>Fly Pollination</i>	191
6.6.1.3 <i>Ant Pollination</i>	192
6.6.1.4 <i>Butterfly Pollination</i>	192
6.6.1.5 <i>Moth Pollination</i>	193
6.6.1.6 <i>Beetle Pollination</i>	195
6.6.2 Pollination by Birds: Ornithophily	195
6.6.3 Pollination by Bats: Chiropterophily	198
6.6.4 Pollination by Snail: Malacophily	198
6.6.5 Some Unusual Pollinators	199
6.7 Ambophily	202
6.8 Pollen Storage	202
6.8.1 Methods of Pollen Storage	203
6.8.2 Utility of Pollen Storage: Some Examples	204
Glossary	205
Key Questions	205
Practicals	
Exercise 6.1: To study the time of anther dehiscence	206
Exercise 6.2: To study the histochemistry of floral rewards	207
Exercise 6.3: To study the floral features of various species and discuss them in context of pollination syndrome	211
Chapter 7. Pollen–Pistil Interactions and Fertilization	216
7.1 Introduction	216
7.2 Stigma and Style	217
7.3 Pollen–Pistil Interactions	221
7.3.1 Pollen Capture and Adhesion	222
7.3.2 Pollen Hydration	225
7.3.3 Pollen Germination	225
7.3.4 Penetration of Stigma by Pollen Tube	226

Contents	xi
7.3.5 Pollen Tube Growth	227
7.3.5.1 <i>Pollen Tube Cytoplasm</i>	227
7.3.5.2 <i>Pollen Tube Wall</i>	229
7.4 Pollen Tube Guidance: Cues from Sporophytic Tissue, Stylar Exudates and Ovule	231
7.5 Pollen Tube Entry into Ovule and Embryo Sac	233
7.6 Double Fertilization	233
7.7 Unique Cases	236
7.8 <i>In vitro</i> Pollen Tube Germination	240
Glossary	242
Key Questions	243
Practicals	
Exercise 7.1: To study the stigma and the styles of different flowers	244
Exercise 7.2: To study the stigma receptivity by cytochemical localization of non-specific esterases and peroxidase activity	244
Exercise 7.3: To test germinability of pollen grains under <i>in vitro</i> condition through various methods	247
Exercise 7.4: To study the pollen tube path in the pistil by decolorized aniline blue staining	249
Chapter 8. Self-Incompatibility	257
8.1 Introduction	257
8.2 Self-incompatibility: Classification and Types	258
8.3 Genetic Control of Self-incompatibility	259
8.3.1 Homomorphic Self-incompatibility	259
8.3.1.1 <i>Gametophytic Self-incompatibility (GSI)</i>	260
8.3.1.2 <i>Sporophytic Self-incompatibility (SSI)</i>	261
8.3.2 Two-loci or Bi-factorial System	262
8.3.3 Heteromorphic Self-incompatibility	262
8.4 Pollen and Pollen Tube Rejection	264
8.4.1 Homomorphic Systems	264
8.4.1.1 <i>Sporophytic Self-incompatibility System</i>	265
8.4.1.2 <i>Gametophytic Self-incompatibility System</i>	267
8.4.2 Heteromorphic Systems	271
8.5 Methods to Overcome Self-incompatibility	273
8.5.1 Mixed Pollination	273
8.5.2 Bud Pollination	273
8.5.3 Stub Pollination	274
8.5.4 Intra Ovarian Pollination	274
8.5.5 <i>In vitro</i> Pollination and Fertilization	275
8.5.6 Modification of Stigmatic Surface	275
8.5.7 Heat Treatment of Style	275

8.5.8	Irradiation	276
8.5.9	Increased Level of Carbon Dioxide	276
8.5.10	Parasexual Hybridization	276
8.5.11	Genome Editing	277
	Glossary	277
	Key Questions	278
Practicals		
	Exercise 8.1: To determine the interspecific incompatibility in species using semi <i>in vivo</i> pollination and decolorized aniline blue staining method	279
	Exercise 8.2: To determine the type of homomorphic self-incompatibility (GSI or SSI) in a species by employing semi <i>in vivo</i> pollination and decolorized aniline blue staining method	281
	Exercise 8.3: To determine the mating/breeding system of a species using <i>in vivo</i> manual pollination	282
	Exercise 8.4: To calculate Index of Self-incompatibility (ISI)	284
	Exercise 8.5: To analyze the breeding system of a species by calculating its Pollen: Ovule ratio	285
Chapter 9. Endosperm		289
9.1	Introduction	289
9.2	Ultrastructural Changes in the Central Cell and Formation of Primary Endosperm Nucleus	290
9.3	Types of Endosperm	292
9.3.1	Nuclear Endosperm	293
9.3.2	Cellular Endosperm	297
9.3.3	Helobial Endosperm	300
9.4	Some Unusual Types of Endosperm	302
9.4.1	Composite Endosperm	302
9.4.2	Ruminate Endosperm	302
9.5	Cellularization of Nuclear Endosperm	303
9.6	Endosperm in Cereals	306
9.7	Hormonal Regulation of Endosperm	312
9.8	Functions of Endosperm	313
9.8.1	Nutrition of Embryo	313
9.8.2	Regulation of Embryo Development	313
9.8.3	Seed Development	314
9.8.4	Seed Germination	315
9.9	Nutritive Tissues other than Endosperm	315
9.9.1	Pseudoembryo Sac/Nucellar Plasmodium	315
9.9.2	Perisperm	316
9.9.3	Chalazosperm	317

Contents	xiii
Glossary	317
Key Questions	318
Practicals	
Exercise 9.1: To dissect and study free-nuclear type of endosperm from developing seeds	319
Chapter 10. Zygotic Embryogenesis	324
10.1 Introduction	324
10.2 Structure of the Embryo	324
10.3 Egg to Zygote: Post-Fertilization Changes, Ultrastructure and Polarity	325
10.4 Embryogeny: From Zygote to Multi-cellular Embryo	327
10.4.1 Types of Embryo Development	328
10.4.2 Early Embryogenesis: Octant Configurations of Pro-embryo	329
10.5 Embryogenesis and Embryo Patterning	332
10.5.1 Embryogenesis and Embryo Pattern Formation in Dicots	332
10.5.2 Embryogenesis in Monocots	334
10.5.3 Embryogenesis in Poaceae	339
10.6 Unusual Features of Embryo and Embryogenesis in Some Angiosperms	340
10.6.1 Embryo Development in <i>Paeonia</i>	341
10.6.2 Reduced Embryos	341
10.7 Suspensor	342
10.7.1 Structure	342
10.7.2 Ultrastructure	344
10.7.3 Role of Suspensor	345
10.8 Embryo Nourishment	347
Glossary	349
Key Questions	349
Practicals	
Exercise 10.1: To study zygotic embryogenesis in dicots using micrographs	350
Exercise 10.2: To dissect young embryo from developing seed	351
Chapter 11. Polyembryony and Apomixis	357
11.1 Introduction	357
11.2 Polyembryony	359
11.2.1 Cleavage of Zygote or Proembryos	359
11.2.2 Formation of Embryos from Cells of Embryo Sac other than Egg Cell	360
11.2.3 Presence of More than One Embryo Sac within Same Ovule	361
11.2.4 Formation of Embryos by Sporophytic Tissue of Ovule	361
11.3 Classification of Polyembryony	363
11.4 Causes and Inheritance of Polyembryony	364
11.5 Practical Applications and Significance of Polyembryony	365
11.6 Apomixis	365

11.7 Types of Apomixis	366
11.7.1 Sporophytic Apomixis	367
11.7.2 Gametophytic Apomixis	367
11.7.2.1 <i>Diplospory</i>	367
11.7.2.2 <i>Apospory</i>	370
11.8 Role of Pollination in Embryo and Endosperm Development among Apomicts	373
11.9 Genetics of Apomixis	373
11.10 Potential Applications of Apomixis	375
11.11 Methods to Screen and Study Apomixis	379
Glossary	380
Key Questions	381
Practicals	
Exercise 11.1: To screen apomixis in ovules using histo-clearing technique	382
Exercise 11.2: To study the polyembryony in seeds	386
Exercise 11.3: To determine the type of embryo by enumerating key features	387
Chapter 12. Seed	390
12.1 Introduction	390
12.2 Structure and Morphology of Seeds	392
12.3 Types of Seed	394
12.3.1 Classification 1: Based on Ovule Type	394
12.3.2 Classification 2: Based on Embryo Size, Shape and Position	395
12.3.3 Other Types	396
12.4 Seed Coat	398
12.4.1 Structure and Development	398
12.4.2 Functions of Seed Coat	406
12.5 Specialized Seed Associated Structures/Appendages	409
12.6 Seed Dispersal	412
12.6.1 Advantages of Dispersal	413
12.6.2 Mechanisms of Dispersal	413
12.6.2.1 <i>Autochory</i>	414
12.6.2.2 <i>Anemochory</i>	417
12.6.2.3 <i>Hydrochory</i>	418
12.6.2.4 <i>Zoochory</i>	420
Glossary	424
Key Questions	425
Practicals	
Exercise 12.1: To calculate the mass and determine the shape (seed traits) of different seeds	426
Exercise 12.2: To classify different types of seeds	428
Exercise 12.3: To study seed dispersal mechanisms in various species	428

<i>Contents</i>	xv
Exercise 12.4: To calculate percentage seed viability, germinability and seed vigor	428
Exercise 12.5: To calculate the ovule: seed ratio	431
Exercise 12.6: Observation of seed dispersal mechanism	432
Chapter 13. Plant Germline Transformation	436
13.1 Introduction	436
13.2 Plant Germline Transformation	437
13.3 Male Germline Transformation	439
13.3.1 <i>Agrobacterium</i> Mediated Transformation	442
13.3.2 Particle Bombardment Method	444
13.3.3 MAGELITR	444
13.3.4 Microinjection	445
13.3.5 Sonication	445
13.3.6 Electroporation	445
13.4 Female Germline Transformation	446
13.4.1 <i>In Planta</i> Agroinfiltration	447
13.4.2 Floral Dip	447
13.4.3 Floral Spray	448
13.4.4 Pollen Tube Mediated Transformation	449
13.4.5 Ovary/Pistil Drip Transformation	449
13.5 Factors Influencing Germline Transformation	450
Glossary	451
Key Questions	452
Practicals	
Exercise 13.1: To identify the uninucleate stage of pollen grains and demonstration of technique of anther culture	452
Exercise 13.2: To demonstrate the floral dip method of germline transformation	456
<i>Index</i>	463
<i>Color Plates</i>	473

Foreword

Plants in general and flowering plants (angiosperms) in particular are the essential components for sustenance of life of all non-photosynthetic organisms on our planet. Plants reproduce by asexual as well as sexual means. Asexual reproduction is not congenial for long-term sustenance and evolutionary processes of the species because of genetic uniformity of the progeny. Sexual reproduction which permits genetic recombination is the dominant mode. Although Angiosperms were the last to evolve as land plants, they soon became the most successful and dominant group amongst land plants. Their success is largely due to the mode of their reproduction through the evolution of the flower and the consequent advantages it brought in. For human beings, flowering plants provide most of their essential needs – food, fibres, shelter, medicines, clean air and water. Reproduction is the basis for sustenance of any species. Thus, understanding reproductive biology of flowering plants is important not only from the fundamental point of view but also for their manipulation for human welfare. Reproductive biology of angiosperms is more complex when compared to other groups of plants because of the involvement of the flower. The progress in understanding the structural and functional aspects of reproduction has been very slow.

Initial studies on reproductive biology of angiosperms were largely confined to examining embryological details using fixed and sectioned materials. Enormous data accumulated over the years on the developmental details of the pollen grains, ovules and female gametophyte, double fertilization, embryo and endosperm, seed and fruit development. These advances were taught to the undergraduate and postgraduate students under the title embryology of angiosperms as a part of their curriculum. Following the development of electron microscopy and histochemistry, embryological details were further elaborated by using these techniques. Development of aseptic culture techniques broadened scope for experimental studies on embryological processes leading to a slow but steady understanding of the functional details of embryological structures. These developments were incorporated in some of the books of embryology under a chapter on experimental embryology. However, there was hardly any integrated account of embryological processes in relation to the structure with their function. Pre-fertilization aspects of reproductive biology covering the details of pollen, pistil, and pollen–pistil interactions, which are unique to angiosperms and play a critical role in their successful evolution, were the last to enter the field of embryology of angiosperm. Surprisingly, pollination on which plenty of literature has long been available and which is a critical requirement for angiosperm reproduction was not a part of embryology.

Now enormous data has accumulated on all aspects of reproductive biology of angiosperms through interdisciplinary studies and it is high time to teach this subject as “Reproductive Biology” (rather than embryology) integrating all these advances starting with flower development until fruit and seed maturation and their dispersal.

Continued research and teaching of reproductive biology of angiosperms has become highly relevant in the light of human-induced environmental changes (intensification of agriculture, habitat loss and degradation, overexploitation of bio-resources, introduction of alien species and climate change) in recent decades and their impact on the sustenance of biodiversity and crop productivity. Human activities have not only accelerated extinction of species but also have pushed a large number of species to endangered status leading to the sixth mass extinction crisis. In the absence of effective remedial measures, a large proportion of biodiversity is likely to become extinct by the end of this century. Therefore, conservation of biodiversity is likely to become one of the most important agendas of the world in the coming decades. Reproduction is the basis for the sustenance of any species. In flowering plants, recruitment of new individuals which is the final step in a series of sequential reproductive events is the basis of species sustenance. Environmental changes have induced severe constraints on many reproductive events, particularly pollination and seed dispersal, leading to recruitment constraint. For any effective conservation of angiosperm species, it is important to understand reproductive biology of endangered species to identify reproductive and/or recruitment constraints and to apply effective measures to overcome such constraints. Plant conservation attempts so far, particularly in developing countries, have not been very successful; one of the reasons being our ignorance of the reproductive biology of the species to be conserved. Knowledge about reproductive biology is important not only for effective conservation but also to monitor the success of conservation measures.

Present book, *Reproductive Biology of Angiosperms: Concepts and Laboratory Methods*, by Yash Mangla, Priyanka Khanduri and Charu Khosla Gupta is going to be an important contribution to the field. It begins with a brief introduction that gives an account of different aspects of reproductive biology and highlights the importance of the subject to other areas of plant biology such as conservation biology, crop production, and evolutionary biology. Historical account, that comes next, elaborates briefly the development of “classical embryology” through various stages into an integrated discipline of “reproductive biology” and highlights the contributions of several well-recognized investigators. Various chapters starting from the flower until seed dispersal give a reasonably comprehensive account of different aspects of reproductive biology. A chapter on genetic transformation is also included at the end. The book is illustrated with photographs and diagrammatic sketches of high quality.

An attempt is made in all the chapters to give an integrated account of reproductive structures (as revealed through light and electron microscopy) and their functions. The deep understanding involved was realized through the application of the techniques from different disciplines such as histochemistry, physiology, biochemistry, molecular biology, and evolutionary biology. Such an integrated account is hardly given in any of the existing books in this field. Boxes and tables have been used profusely to provide clarity on many

Foreword

xix

aspects. Glossary of a large number of technical terms and key questions are given at the end of each chapter. The details of the practical exercises given for each chapter are going to be very useful for the teachers as well as students. To my knowledge there is no such book available so far in this field. The present book is thus a very welcome addition to the literature on reproductive biology of angiosperms. I congratulate the authors for compiling such a book. I am confident that the volume is going to be very useful not only for teachers and students of Reproductive Biology but also those interested in any aspect of reproduction of angiosperms.

Preface

The inception of interest in understanding mechanisms of plant reproduction is as old as inception of interest in biology. The seminal work and critical observations by Charles Darwin can be regarded as a foundation for establishing a wide interest in pollinators and reproductive biology of angiosperms as a formal subject. In the last few decades, systematic field investigations, advancement of microscopy tools, and molecular techniques have taken the reproductive biology of angiosperms to a new zenith. The scope of the subject is no longer limited to just studying embryo-endosperm development and taxonomic studies but is extended to study the effect of climate change, evolution, conservation of threatened taxa, raising commercial plantations and orchards, pollinator management, seed development, population biology, phyto-geography, and much more. The reproductive biological studies are also closely linked with the understanding of, physiology, genetics and epigenetics of plants.

For a thorough understanding of the subject, a textbook summarizing the basic concepts of plant reproduction integrated with current research, is the need of the hour for both students and instructors. The aim of the present book is to provide a comprehensive account of basic concepts and recent developments in the field of reproductive biology of flowering plants with essential practical exercises. The book extensively covers all the topics from structure of a flower to seed dispersal and presents the concepts with accompanying color photographs and illustrations wherever necessary, to enhance the level of a student's perception. The new, advanced and interesting information is also provided in a box format in each chapter to reinforce learning. An elaborate glossary and questions are provided with each chapter for quick revision and concept enhancement. Boxes summarizing differences between two terms/concepts which students otherwise usually find difficult to comprehend have also been furnished in the book. This book is a blend of theoretical concepts and details of hands-on exercises in the field and laboratory. Methods for field observations, sample observation tables, and suggestions for plant materials to be used for classroom studies/demonstrations pertaining to each concept have also been provided. In addition, the observation sections under practicals are supplemented with the photographs. This should surely help the instructors to demonstrate and students to grasp the concept effectively.

The current book has been specially structured keeping in mind the syllabi of the leading universities in the country. The content is all inclusive of different curricula frameworks implemented by the University Grants Commission across the universities. It can be used

as a text book as well as a reference book by both graduate and undergraduate students along with researchers in the field. The glossary of technical terms at the end of each chapter should help students for quick revision for their competitive and entrance examinations. We hope the present edition of the book will certainly turn into a knowledge resource for the young minds and learners in the field.

Acknowledgments

We want to thank all those related directly or indirectly to this book. We dedicate this book to our mentors Late Professor H. Y. Mohan Ram, Professor K. R. Shivanna and Professor Rajesh Tandon who have been a constant source of inspiration and motivation for all three of us. We hold a deep sense of gratitude and reverence towards them. We are also thankful to Professor S. C. H. Barrett and Professor Odair José Garcia de Almeida for readily providing us with some wonderful photographs. We are equally indebted to all the researchers in the field of reproductive biology who supplemented our effort by providing illustrations and photographs from their original research. Our friends from the botany fraternity, Dr. P. Chitralkha, Dr. Sudip Kumar Roy, Dr. Chandan Barman, Dr. Vineet Kumar Singh, Mr. Arjun Adit, and Mr. Ashish Jangam very graciously shared their research work for which we are deeply obliged. We are also thankful to the International Association of Sexual Plant Reproduction Research (IASPRR) and the University of Wisconsin, Stevens Biology Lab for consenting to our use of images from their work. The permissions to use images from the Copyright Clearance Centre, Indian National Science Academy, Indian Academy of Sciences, Phytomorphology, Journal of Indian Botanical Society, Brazilian Journal of Botany and various journals have been invaluable and duly acknowledged. Our thanks are also due to all the creators whose work (text, figures, and illustrations) licensed under Creative Commons and free and open access journals, has been used in this book. The impetus for writing and publishing this book provided by Professor Ravi Toteja, Officiating Principal Acharya Narendra Dev College, University of Delhi and Dr. Ram Swarup Gangopadhyay, Principal, Vidyasagar Metropolitan College, University of Calcutta is deeply appreciated. Professor Toteja was also kind enough to run the plagiarism checks for our chapters. Hence, we take this opportunity to thank him and the University of Delhi for providing access to plagiarism software “Urkund”, which helped immensely in making the content original. We are also thankful to the anonymous reviewers for their constructive comments and suggestions which encouraged us to not skip even the minutest details of the subject.

We are indebted to Dr. Vaishali Thapliyal, Senior Commissioning Editor at Cambridge University Press, for helping us bring out this comprehensive volume. She has been instrumental right from inception of proposal till its printing. Support provided by Cambridge University Press and staff members, especially Mr. Aniruddha De and Mr. Vikash Tiwari, is duly recognized.

Last but not the least we really thank our families and friends who supported us in this herculean venture.
