## SCHRÖDINGER OPERATORS: EIGENVALUES AND LIEB–THIRING INEQUALITIES

The analysis of eigenvalues of Laplace and Schrödinger operators is an important and classical topic in mathematical physics with many applications. This book presents a thorough introduction to the area, suitable for masters and graduate students, and includes an ample amount of background material on the spectral theory of linear operators in Hilbert spaces and on Sobolev space theory.

Of particular interest is a family of inequalities by Lieb and Thirring on eigenvalues of Schrödinger operators, which they used in their proof of stability of matter. The final part of this book is devoted to the active research on sharp constants in these inequalities and contains state-of-the-art results, serving as a reference for experts and as a starting point for further research.

**Rupert L. Frank** holds a chair in applied mathematics at LMU Munich and is doing research primarily in analysis and mathematical physics. He is an invited speaker at the 2022 International Congress of Mathematics.

**Ari Laptev** is Professor at Imperial College London. His research interests include different aspects of spectral theory and functional inequalities. He is a member of the Royal Swedish Academy of Science, a Fellow of EurASc and a member of Academia Europaea.

**Timo Weidl** is Professor at the University of Stuttgart. He works on spectral theory and mathematical physics.

<b>Preface</b>	<i>page xi</i>
<b>Overview</b>	1
<b>PART ONE BACKGROUND MATERIAL</b>	5
<b>1 Elements of Operator Theory</b>	7
1.1 Hilbert spaces, self-adjoint operators and the spectral theorem	8
1.2 Semibounded operators and forms, and the variational principle	29
1.3 Comments	64
<b>2 Elements of Sobolev Space Theory</b>	66
2.1 Weak derivatives	67
2.2 Sobolev spaces	85
2.3 Compact embeddings	96
2.4 Sobolev inequalities on the whole space	103
2.5 Friedrichs and Poincaré inequalities	112
2.6 Hardy inequalities	127
2.7 Homogeneous Sobolev spaces	142
2.8 The extension property	146
2.9 Comments	157
<b>PART TWO THE LAPLACE AND SCHRÖDINGER OPERATORS</b>	165
<b>3 The Laplacian on a Domain</b>	167
3.1 The Dirichlet and Neumann Laplacians	170
3.2 Weyl’s asymptotic formula for the Dirichlet Laplacian	179

3.3	Weyl's asymptotic formula for the Neumann Laplacian	192
3.4	Pólya's inequality for tiling domains	197
3.5	Lower bounds for the eigenvalues of the Dirichlet Laplacian	199
3.6	Upper bounds for the eigenvalues of the Neumann Laplacian	209
3.7	Phase space interpretation	212
3.8	Appendix: The Laplacian in spherical coordinates	219
3.9	Comments	232
<b>4</b>	<b>The Schrödinger Operator</b>	<b>244</b>
4.1	Definition of the Schrödinger operator	247
4.2	Explicitly solvable examples	251
4.3	Basic spectral properties of Schrödinger operators	265
4.4	Weyl's asymptotic formula for Schrödinger operators	279
4.5	The Cwikel–Lieb–Rozenblum inequality	282
4.6	The Lieb–Thirring inequality	292
4.7	Extending inequalities and asymptotics	298
4.8	Reversed Lieb–Thirring inequality	303
4.9	Comments	308
	<b>PART THREE SHARP CONSTANTS IN LIEB–THIRRING INEQUALITIES</b>	<b>319</b>
<b>5</b>	<b>Sharp Lieb–Thirring Inequalities</b>	<b>321</b>
5.1	Basic facts about Lieb–Thirring constants	323
5.2	Lieb–Thirring inequalities for special classes of potentials	335
5.3	The sharp bound for $\gamma = \frac{1}{2}$ in one dimension	349
5.4	The sharp bound for $\gamma = \frac{3}{2}$ in one dimension	353
5.5	Trace formulas for one-dimensional Schrödinger operators	362
5.6	Comments	380
<b>6</b>	<b>Sharp Lieb–Thirring Inequalities in Higher Dimensions</b>	<b>385</b>
6.1	Schrödinger operators with matrix-valued potentials	388
6.2	The Lieb–Thirring inequality with the semiclassical constant	395
6.3	The sharp bound in the matrix-valued case for $\gamma = \frac{3}{2}$	400
6.4	Trace formulas in the matrix case	411
6.5	Comments	414
<b>7</b>	<b>More on Sharp Lieb–Thirring Inequalities</b>	<b>417</b>
7.1	Monotonicity with respect to the semiclassical parameter	418
7.2	Bounds for radial potentials	426

<i>Contents</i>		ix
7.3	More on the one-particle constants	434
7.4	The dual Lieb–Thirring inequality	436
7.5	Comments	448
<b>8</b>	<b>More on the Lieb–Thirring Constants</b>	<b>451</b>
8.1	More on Lieb–Thirring inequalities in the matrix-valued case	452

## Preface

Ever since E. H. Lieb and W. Thirring published their celebrated work *Inequalities for the moments of the eigenvalues of the Schrödinger Hamiltonian and their relation to Sobolev inequalities* (Lieb and Thirring, 1976), the branch of spectral theory related to such inequalities has flourished and these bounds are now named for them.

In their 1976 paper Lieb and Thirring developed a family of inequalities, of which they had used a special case in an earlier (1975) paper, to prove stability of matter. Their approach simplified and improved the work by Lenard and Dyson (1968), and introduced fundamental ideas in the analysis of fermionic quantum many-body systems.

Lieb–Thirring inequalities come in two different versions, namely a spectral form and a kinetic (or dual) form. The kinetic form is most directly applicable to quantum many-body systems and provides a lower bound on the total kinetic energy in terms of certain simple effective characteristic of the state. It is a mathematical expression of the uncertainty and Pauli exclusion principles and a far-reaching generalization of Sobolev inequalities. The spectral form of the Lieb–Thirring inequalities concerns the negative eigenvalues  $-E_j$  of the one-particle Schrödinger operator

$$H = -\Delta - V$$

and provides upper bounds on the Riesz means

$$\sum_j E_j^\gamma, \quad \gamma > 0,$$

that only involve an  $L^p$  norm of  $V$ . In the special case  $\gamma = 1$ , these bounds are equivalent to the kinetic form of the Lieb–Thirring inequalities.

It turned out that this form is also very useful in the study of the dimension of attractors for the Navier–Stokes and other non-linear evolution equations.

Originally, it was calculated by exploiting the available Sobolev inequalities and then employing the relationship between that dimension and the prevailing Lyapunov exponents, as first conjectured by Farmer et al. (1983). This effective, but somewhat cumbersome approach was significantly simplified by the use of the Lieb–Thirring improvement of the Sobolev inequalities (Lieb, 1984; Constantin et al., 1985; Temam, 1997).

Lieb–Thirring inequalities are also important in the study of properties of the essential spectrum of Schrödinger operators. Deift and Killip (1999) were able to obtain a sharp result on the absolute continuity of the positive spectrum for one-dimensional Schrödinger operators using a trace formula by Zaharov and Faddeev (1971); see also Killip and Simon (2009). Such trace formulas provide identities between characteristics of the spectrum (eigenvalues and scattering data) and some functionals involving electric potentials of Schrödinger operators. In addition, they describe integrals of motions of the Korteweg–De Vries (KdV) equation. It is worth noting that one such trace formula was used by Gardner et al. (1974) to prove a special case of what came to be called the Lieb–Thirring inequalities. Later a version of this trace formula for matrix-valued potentials played an important role in obtaining sharp constants in Lieb–Thirring inequalities for multi-dimensional Schrödinger operators (Laptev and Weidl, 2000b). It is remarkable that some sharp constants in Lieb–Thirring inequalities are related to soliton-type potentials appearing in the theory of the KdV equation.

Spectral inequalities in the special case  $\gamma = 0$ , which correspond to bounds on the number of negative eigenvalues of Schrödinger operators, have an even longer history. After initial results by Bargmann, Birman, Schwinger, Calogero and others, a systematic investigation was started in the Russian school of M. Birman and M. Solomyak and in the US by B. Simon and E. Lieb. The respective estimates are known as Cwikel–Lieb–Rozenblum (CLR) inequalities (Cwikel, 1977; Lieb, 1976, 1980; Rozenbljum, 1972a, 1976). One of the main motivations for proving such inequalities was to obtain necessary and sufficient conditions on the potentials for admitting Weyl asymptotics. By now, there are at least seven proofs of the CLR bound using rather different tools from mathematical analysis.

It has been more than four decades since the paper of Lieb and Thirring was published, and the theory of Lieb–Thirring inequalities is still a very dynamically developing area of functional analysis and mathematical physics. The main conjecture on the sharp Lieb–Thirring constant for  $\gamma = 1$  in dimension three remains open. This area has become a well-established part of analysis that generates beautiful new ideas and that finds applications beyond the spectral theory of Schrödinger operators.

This book is aimed at presenting the current state of the art of some parts of spectral theory of partial differential equations. Our intention was to write a book that covers some new results connected to spectral properties of Schrödinger and Laplace operators that have been obtained during the last few decades. Most of them are focused around our own interests related to Lieb–Thirring inequalities. While writing the text and when giving courses based on preliminary versions of the book, we faced the problem that we needed a lot of material from the general spectral theory of self-adjoint operators in Hilbert spaces and a number of standard functional inequalities. Including all this has substantially increased the size of the book and forced us to postpone some core material for the future. We now hope that the book might be useful not only to our colleagues who are interested in spectral inequalities, but also to students specializing in analysis.

### Acknowledgements

We would like to express our appreciation to M. Birman, E. Lieb, B. Simon and M. Solomyak who profoundly influenced our mathematical taste. We have been fortunate to have had the opportunity to collaborate with so many individuals on the topic of Lieb–Thirring and spectral inequalities. We would like to thank our teachers and students, colleagues and friends for all the inspiring discussions.

We owe a great debt to J. Peteranderl who read a preliminary version of this book line by line and found countless minor and major inaccuracies. For valuable remarks, suggestions and corrections we are very grateful to C. Dietze, F. Gesztesy, A. Ilyin, V. Kußmaul, S. Larson, M. Lewin, E. Lieb, G. Rozenblum, L. Schimmer and H. Siedentop. Our special thanks go to E. Lieb and B. Simon for their interest in this book and their constant encouragement.

We are grateful to David Tranah and the team at CUP for their assistance when publishing the book.

Parts of this book were written at Caltech, Imperial College London, KTH Stockholm, LMU Munich, Mittag–Leffler Institute, Oberwolfach Research Institute, Stuttgart University, and Tsinghua University, and we would like to thank all these institutions for their hospitality.

Partial support through US National Science Foundation grants PHY-1068285, PHY-1347399, DMS-1363432 and DMS-1954995 and through the Deutsche Forschungsgemeinschaft EXC-2111-390814868 (R.L.F.) is acknowledged.
