

Contents

Preface	<i>page</i> ix
How to Use the Book	xii
First Steps	xv
Basic Mathematical Operations	xv
0.1 Finding Roots of a 1D Function	xv
0.2 Finding Minimum of a 1D Function	xvi
0.3 Exercises	xviii
Project 1: Rectangular Finite Quantum Well – Stationary Schrödinger Equation in 1D	1
1.1 Physics Background: Chosen Ideas of Quantum Mechanics	1
1.2 Problem: Eigenenergies and Eigenfunctions in Rectangular Finite Quantum Well	4
1.3 Numerical Methods: Finding Roots of Characteristic Functions	5
1.4 Exercises	6
Project 2: Diffraction of Light on a Slit	7
2.1 Physics Background: Elements of Wave Physics	7
2.2 Problem: Diffraction of a Wave on a Slit	10
2.3 Numerical Methods: Schemes Based on Local Approximations of a Function	11
2.4 Exercises	14
Project 3: Pendulum as a Standard of the Unit of Time	18
3.1 Physics Background: Newton’s Laws of Motion, Equation of Motion	18
3.2 Problem: Simple Pendulum as a Standard of the Unit of Time	19
	v

3.3	Numerical Methods: Recursive Methods Based on Local Extrapolation of One-Step Integral Integrand	21
3.4	Exercises	23
	Project 4: Planetary System	26
4.1	Physics Background: Law of Universal Gravitation	26
4.2	Problem: Motion of Planets in the Field of a Fixed Star	28
4.3	Reduction of a Single Planet Motion in a Central Field to 1D	29
4.4	Numerical Method: Verlet Algorithm	31
4.5	Exercises	31
	Project 5: Gravitation inside a Star	34
5.1	Physics Background: Gauss’s Law, Poisson’s Equation	35
5.2	Problem: Gravitational Field Due to a Continuous Mass Density Distribution	36
5.3	Numerical Method: Numerov–Cowells Algorithm	37
5.4	Exercises	38
	Project 6: Normal Modes in a Cylindrical Waveguide	40
6.1	Physics Background: Wave Equation, Standing Waves	40
6.2	Problem: Normal Modes in an Optical Fibre	41
6.3	Numerical Method: Shooting Method	42
6.4	Exercises	43
	Project 7: Thermal Insulation Properties of a Wall	45
7.1	Physics Background: Steady-State Diffusion	45
7.2	Problem: Steady-State Diffusion of Heat through the Wall	46
7.3	Numerical Method: Finite Difference Method	47
7.4	Exercises	50
	Project 8: Cylindrical Capacitor	52
8.1	Physics Background: Variational Principle for Electrostatic Systems	53

8.2	Problem: Cylindrical Capacitor	54
8.3	Numerical Method: Finite Elements (FE) Method	54
8.4	Exercises	56
Advanced Projects		57
Project 9: Coupled Harmonic Oscillators		58
9.1	Problem: Equations of Motion of Coupled Oscillators	58
9.2	Exercises	60
Project 10: The Fermi–Pasta–Ulam–Tsingou Problem		64
10.1	Problem: Dynamics of a One-Dimensional Chain of Interacting Point Masses	64
10.2	Exercises	70
Project 11: Hydrogen Star		72
11.1	Problem: Mass Density Distribution in a Cold Hydrogen Star	72
11.2	Numerical Method	73
11.3	Exercises	76
Project 12: Rectangular Quantum Well Filled with Electrons – The Idea of Self-Consistent Calculations		78
12.1	Problem: Quantum Well Filled with Electrons and Charge Neutralising Jellium	79
12.2	Exercises	80
Project 13: Time Dependent Schrödinger Equation <i>Dawid Dworżański</i>		81
13.1	Problem: Time Evolution of a Wave Function in 2D Quantum Well	81
13.2	Exercises	84
Project 14: Poisson’s Equation in 2D		86
14.1	Problem: Variational Computational Approach to a 2D Electrostatic System	86
14.2	Numerical Method: Finite Elements (FE) Method	87
14.3	Exercises	89

Appendix A: Supplementary Materials	92
A.1 Euler Representation of a Complex Number	92
A.2 Local Representation of a Function as a Power Series	94
A.3 Wilberforce’s Pendulum	96
A.4 Dispersion Relation for FPU Problem	96
A.5 Equivalence of Variational Principle and Poisson’s Equation in Electrostatics	97
A.6 First and Second Uniqueness Theory	98
A.7 Discretisation of 2D Laplace’s Functional	100
A.8 Density of Star	102
A.9 Energy and Pressure of a Cubic Hydrogen Atom Lattice as a Function of Unit Cell Volume	105
Further Reading	107
Index	108
