## STONE TOOLS AND FOSSIL BONES

The stone tools and fossil bones from the earliest archaeological sites in Africa have been used over the past fifty years to create models that interpret how early hominins lived, foraged, behaved, and communicated, and how early and modern humans evolved. In this book, an international team of archaeologists and primatologists examines early Stone Age tools and bones and uses scientific methods to test alternative hypotheses that explain the archaeological record. By focusing on both lithics and faunal records, this volume presents the most holistic view to date of the archaeology of human origins.

Manuel Domínguez-Rodrigo is Co-Director of the Institute of Evolution in Africa, based in Madrid, Spain, and Professor in the Department of Prehistory at the Complutense University, Madrid. He is the author of *Deconstructing Olduvai* and *Peninj: A Research Project on Human Origins*. Currently, he is Co-Director of the Olduvai Paleoanthropology and Paleocology Project (TOPPP) at Olduvai Gorge, Tanzania.

## Tables

1.1. Principal elements for a definition of human behavior	<i>page</i> 15
1.2. A proposed theory for the origin of human behavior	17
1.3. Hypotheses and their testing premises composing the theory of the emergence of human behavior	18
1.4. Refined description of concepts contained in factual hypotheses	30
2.1. Interpretations of the methodological utility of cut marks and of the data on these bone surface modifications from east African Plio-Pleistocene sites	52
9.1. Description of several variables used for the analysis of the Peninj lithic material	250
9.2. List and brief description of the replicated experiments for the study of the Peninj materials	254
9.3. List of hammerstones used for the experimental replication in the Peninj study	255
9.4. Variables used in the Peninj experimental program	256
9.5. Schematic reconstruction of the various reduction models of cores in the Peninj experimental research	257
9.6. Mean values of the three lithic samples in the Peninj study	267
9.7. Coefficients of discriminants in the Peninj archaeological and experimental collections	272

## Figures

1.1.	Interrelations among founder and factual hypotheses.	page 27
1.2.	An example of a suggested heuristic index.	33
1.3.	Scheme of the progressive increasing knowledge concept, inherent to scientific realism.	37
2.1.	Experimental matrix showing the conceptual assumptions in interpretations of cut marks.	55
3.1.	Medial view of the left femur of an elk ( <i>Cervus elaphus</i> ) showing stone tool cut marks.	83
3.2.	Examples of percussion marks.	85
3.3.	Views of the right humerus of a white-tailed deer ( <i>Odocoileus virginianus</i> ) showing various types of carnivore damage.	87
3.4.	Tibia fragment from the site of DK in Bed I at Olduvai Gorge (ca. 1.8 million years old) showing sediment abrasion, probably caused by trampling.	91
7.1.	Diversity in nut cracking across nine chimpanzee populations.	207
7.2.	Density (number of tools per m <sup>2</sup> ) of anvil and hammer tools across seventeen nut-cracking sites at Bossou (Guinea).	212
7.3.	Probability distribution of anvils alone, hammers alone, and anvils and hammers together at varying distances from the nut tree at seventeen sites combined.	213
7.4.	Density (number of tools per m <sup>2</sup> ) of excavated artifacts across twenty-three Oldowan sites.	215
9.1.	Graphic representation of the criteria followed for the diacritical analysis of the Peninj cores.	253
